### Schneider Electric - North American Operating Division

#### 8001 Knightdale Blvd. Knightdale, NC 27545 Tel: 919-266-3671

19 Waterman Avenue Toronto, Ontario M4B 1Y2 Tel: 416-752-8020 The information provided in this documentation contains general descriptions and/or technical characteristics of the performance of the products contained herein. This documentation is not intended as a substitute for and is not to be used for determining suitability or reliability of these products for specific user applications. It is the duty of any such user or integrator to perform the appropriate and complete risk analysis, evaluation and testing of the products with respect to the relevant specific application or use thereof. Neither Schneider Electric nor any of its affiliates or subsidiaries shall be responsible or liable for misuse of the information contained herein. **Please note:** not all parts listed in this catalog are available in all countries.

(6) TSX H57 24M/44M Hot Standby processors do not support the Ethernet I/O Scanning service.
(7) TSX P57 4634M/5634M/6634M processors with integrated Ethernet port do not support the PCMCIA Fipway card.
(8) The second value applies to TSX P57 254M/354M processors with integrated Fipio link and to the TSX H57 24M Hot Standby processor.
(9) The integrated Ethernet port requires one of the available network connections.
(10) The integrated Ethernet port is dedicated to Hot Standby communication (CPU Sync link between "Primary" and "Redundant" processors).

O New feature

### Presentation

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Unity<sup>™</sup> processors

### Presentation

Modicon<sup>®</sup> Premium<sup>™</sup> TSX<sup>™</sup> P57 ●●4M, TSX P57 ●●34M and TSX H●4M automation platform processors manage the entire PLC station comprising:

- Discrete I/O modules
- Preventa<sup>™</sup> safety modules
- Analog I/O modules
- Application-specific modules (counter, motion, weighing, communication)

The Premium processor offer has seen the addition of three new references:
 TSX P57 6634M, high-end processor with 1 integrated Ethernet Modbus®/TCP port and an internal 2 Mb RAM

**TSX H57 24M/44M**, that supports the Hot Standby system (with "Primary" and "Secondary" PLCs), see pages 4/60 to 4/69

The processors differ in terms of their memory capacities, processing speeds, the number of I/O and the number of communication ports. Depending on the model, they include:

■ 1 to 16 racks interconnected by means of Bus X (max. distance: 700 m)

- 192 to 2040 discrete I/O
- 12 to 512 analog I/O

■ 4 to 64 application-specific channels. Each application-specific module (counter motion control, communication or weighing) accounts for one or more application-specific channels.

■ 1 to 4 networks (Ethernet Modbus/TCP, Fipway<sup>®</sup>, Modbus Plus<sup>™</sup>, Ethway), 1 to 8 AS-Interface buses

■ 0 or 1 Fipio<sup>®</sup> bus, 0 or 1 CANopen or Modbus Plus bus and 0 to 5 INTERBUS<sup>®</sup> or Profibus DP<sup>™</sup> (1) fieldbuses

0 to 30 process control channels, with each channel capable of supporting up to 3 loops

Depending on the model, Premium<sup>™</sup> processors also feature:

A 10BASE-T/100BASE-TX Ethernet Modbus/TCP port (RJ45 connector)

A 1 Mbit/s Fipio bus link (bus manager)

 Communication via 2 terminal ports (TER and AUX) using Uni-Telway or character mode protocol (typically a 19 or 115 Kbit/s programming terminal and an operator dialog terminal)

A USB type TER port (for connecting a programming terminal)

Each processor has two slots for a PCMCIA card:

 An upper slot (no. 0) for battery-backed memory extension cards (program, symbols, constants and/or data files)

A lower slot (no. 1) for (1) a network card (Fipway, Modbus Plus) or bus

(CANopen, Fipio Agent, Modbus, Uni-Telway and serial links). Memory extension cards intended specifically for storing data can also be inserted into this slot.

#### Treatment for harsh environments

**O** If the Modicon Premium automation platform is destined for use in extremely harsh environments, the "*conformal coating*" offer is available. This involves applying a coat of "*humiseal 1A33*" varnish to the electronic cards of the processor and power supply modules, I/O modules on Bus X and the racks. See page 9/2.

### Premium application design and installation

The installation of these Premium processors requires:

■ Unity<sup>™</sup> Pro Medium, Large or Extra Large programming software. This is the same as the software for installing the Modicon M340 and Modicon Quantum platforms.

Optionally, depending on requirements:

□ The Unity Application Generator (UAG) specialist software for modelling and generating process applications

 Unity EFB toolkit software for developing EF and EFB libraries in C language
 Unity SFC View software for visualizing and diagnosing applications written in Sequential Function Chart (SFC) or Grafcet language

O New feature

<sup>(1)</sup> TSX H57 24M/44M Hot Standby processors do not support the following buses or networks: Fipio, CANopen, Modbus Plus, INTERBUS and Profibus DP.

## Description

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Unity<sup>™</sup> processors

TSX P57 104M

TSX P57 154M

TSX P57 204M/304M

TSX P57 254M/354M/454M

### TSX<sup>™</sup> P57●●4M processors without integrated Ethernet port

TSX P57 1•4M single-format processors and TSX P57 2•4/3•4M double-format processors feature the following on the front panel:

- 1 A display block with 5 LEDs:
- □ RUN LED (green): Processor in operation (program running) □ ERR LED (red): Controller detected fault on the processor or its on-board devices
- (PCMCIA memory card and PCMCIA communication card)
- □ I/O LED (red): Controller detected fault occurring on another station module or configuration fault
- □ TER LED (yellow): Activity on TER or AUX terminal port
- □ FIP LED (red): Activity on integrated Fipio® bus (depending on model)
- 2 RESET button causing a cold restart of the PLC when it is activated
- An 8-way female mini-DIN connector marked TER for connecting a programming 3 or adjustment terminal (RS 485)
- 4 An 8-way female mini-DIN connector marked AUX for connecting a programming, adjustment or operator dialog terminal (RS 485)
- 5 A PCMCIA slot (no. 0) for a memory card
- A PCMCIA slot (no. 1) for a communication card or memory extension card for 6 storing additional data 7
  - A 9-way SUB-D connector (on TSX P57 154/254/354M models) for Fipio bus communication (Fipio manager port)
- 8 An air recirculating heatsink (on TSX P57 0244/1•4M models)

TSX P57 0244M

### **Processor with integrated CANopen port**

- The TSX P57 0244M processor features:
- 1 A display block with 4 LEDs:
- □ RUN LED (green): Processor in operation (program running)
- □ ERR LED (red): Controller detected fault on the processor or its on-board devices (PCMCIA memory card and PCMCIA communication card)
- □ I/O LED (red): Controller detected fault occurring on another station module or configuration fault
- □ TER LED (yellow): Activity on TER or AUX terminal port
  - RESET button causing a cold restart of the PLC when it is activated
- An 8-way female mini-DIN connector marked TER for connecting a programming 3 or adjustment terminal (RS 485)
- 4 An 8-way female mini-DIN connector marked AUX for connecting a programming, adjustment or operator dialog terminal (RS 485)
- 5 A PCMCIA slot (no. 0) for a memory card
- A PCMCIA slot (no. 1) equipped with PCMCIA CANopen master V4.02 card, 6
- complete with cordset and tap junction (see page 5/65)
- 7 An air recirculating heatsink.

- 1 A display block with 5 LEDs:
- RUN LED (green): Processor in operation (program running)
- □ ERR LED (red): Controller detected fault on the processor or its on-board devices (PCMCIA memory card and PCMCIA communication card)
- □ I/O LED (red): Controller detected fault occurring on another station module or configuration fault
- □ TER LED (yellow): Activity on TER or AUX terminal port
- 2 A display block relating to the integrated Ethernet port featuring 5 LEDs:
- □ RUN LED (green): Ethernet port ready
- □ ERR LED (red): Ethernet port operative
- □ COL LED (red): Collision detection
- □ STS LED (yellow): Ethernet link diagnostics
- □ Two TX and RX LEDs (yellow): Transmission/reception activity
- 3 RESET button causing a cold restart of the PLC when it is activated
- 4 An 8-way female mini-DIN connector marked TER for connecting a programming or adjustment terminal (RS 485)
- 5 An 8-way female mini-DIN connector marked AUX for connecting a programming, adjustment or operator dialog terminal (RS 485)
- 6 An RJ45 connector for connection to the Ethernet Modbus/TCP 10BASE-T/100BASE-TX network
- 7 A PCMCIA slot (no. 0) for a memory card
- 8 A PCMCIA slot (no. 1) for a communication card or memory extension card for storing additional data

Unity<sup>™</sup> processors

TSX P57 454M/554M

TSX P57 4634M/5634M TSX P57 6634M

### TSX<sup>™</sup> P57 4●4/5●4/6634M and TSX H57 ●4M high-performance processors (1)

Modicon® Premium<sup>™</sup> double-format high-performance processors TSX P57 454/554M/4634M/5634M/6634M and TSX H57 24M/44M (1) feature the following on the front panel:

- 1 A display block with 5 LEDs:
- □ RUN LED (green): Processor in operation (program running)
- □ ERR LED (red): Controller detected fault on the processor or its on-board devices
- (PCMCIA memory card and PCMCIA communication card) □ I/O LED (red): Controller detected fault occurring on another station module or

configuration fault

- TER LED (yellow): Activity on the AUX terminal port
- □ FIP LED (red): Activity on integrated Fipio bus (TSX P57 454/554M model)

### In the case of models with an integrated Ethernet port

(TSX P57 4634M/5634M/6634M), this display block features 6 additional LEDs:

- RUN LED (green): Ethernet port ready
- □ ERR LED (red): Ethernet port inoperative
- □ COL LED (red): Collision detection
- □ STS LED (yellow): Ethernet link diagnostics
- Two TX and RX LEDs (yellow): Transmission/reception activity
- 2 A "Memory extract" button for extracting the PCMCIA memory extension card. The associated "Memory extract ready" LED indicates that this card can be extracted safely.
- 3 RESET button causing a cold restart of the PLC when it is activated
- An 8-way female mini-DIN connector marked AUX for connecting a programming, 4 adjustment or operator dialog terminal
- 5 A USB type connector marked TER for connecting a programming terminal (requires the PC-compatible 3 m connection cable, reference UNY XCA USB 033, to be ordered separately)
- 6 A PCMCIA slot (no. 0) for a memory extension card
- 7 A PCMCIA slot (no. 1) for a communication card or memory extension card for storing additional data
- A 9-way SUB-D connector (on TSX P57 454M/554M models) for Fipio bus 8 communication (Fipio manager port)
- An RJ45 connector (on TSX P57 4634M/5634M/6634M models) for connection to 9 the Ethernet Modbus/TCP 10BASE-T/100BASE-TX network

### **USB** port

The USB port 5 boasts a faster useful data rate (12 Mbit/s) than the Uni-Telway terminal port available on Premium processors. The USB port is compatible with Unity Pro programming software and the OPC Factory Server (OFS).

TSX P57 4e4M/5e4M/6634M processors can be connected to a USB bus comprising several peripheral devices. However:

- Only one processor must be connected to the USB bus
- No device on the USB bus (modem, printer) can be controlled by the PLC.

(1) TSX H57 24M/44M Hot Standby processor, see description on page 4/61.

## Memory structure

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Unity<sup>™</sup> processors

1

The application memory is divided into memory areas, that are physically distributed across the internal RAM and 0, 1 or 2 PCMCIA memory extension cards:

1 The application data that is in the internal RAM, is divided into two possible types: □ Located data, corresponding to data defined by an address (e.g. %MW237), that can have a symbol linked to it (e.g. Counter\_rejects).

Unlocated data, corresponding to data defined only by a symbol. This type of addressing eliminates the problems of memory mapping management, because addresses are assigned automatically. It also facilitates data structuring.
 DFB unlocated data, corresponding to DFB user function block data. The size of this area is determined by the physical size of the available internal RAM. The available RAM depends on the processor model, see pages 1/12 and 1/13.

2 Area in internal RAM or PCMCIA memory card for the program and symbols. If this area happens to be inside the internal RAM, it also contains the area for modifying the program in online mode (1).

This area contains the program's executable binary code and IEC source code. The user selects the type of information to be stored in the PLC memory.

- 3 Constants area in the internal RAM or the PCMCIA memory card (slot no. 0)
- 4 Area for storing additional data (slot no. 0 or no. 1), e.g. for production data and manufacturing recipes

### Memory organization

Memory structure

The memory will be organized in one of two ways, depending on whether the Premium processor is fitted with 0, 1 or 2 memory extension cards:

■ Application in internal RAM: In this case, the application is completely loaded into the processor's internal battery-backed RAM (2), the capacity depends on the processor model (96 Kb to 2 Mb).

■ Application in PCMCIA card: In this case, the internal RAM is reserved for the application data. The PCMCIA memory card (slot no. 1) contains the program space (program, symbols and constants areas) (128 Kb to 2 Mb). Certain types of PCMCIA memory card also host the data storage area (max. 6976 Kb).

### Symbols areas

Having the symbols area in the same place as the program area is optional. However, if the application symbols database is available on the PLC, it means that, when an empty programming terminal is connected to the PLC, the elements needed to debug or upgrade this PLC can be transferred to the terminal.

Processor with data storage type memory card in slot no. 0

 If a PCMCIA card has been inserted, it is the memory on this memory card that will be used for the purpose of modifying the program in online mode (outside areas 2, 3 and 4 opposite).
 The internal RAM is backed up by an optional battery (with a service life of 3 years). The battery is located in the power supply module (see page 2/4).

### Processor with PCMCIA memory card in slot no. 0

## *Memory structure* (continued)

## **Modicon<sup>®</sup> Premium**<sup>™</sup> automation platform

Unity<sup>™</sup> processors

Processor with mixed type memory card in slot no. 0 and data storage type memory card in slot no. 1 (1)

(1) TSX P57 20 processors and higher

### Memory structure (continued)

### Extension of the data storage area

Memory cards reserved for data storage (4096 or 8192 Kb) are used to: Access the data storage area in cases where the application is fully loaded into the internal RAM. In this case, the data storage memory card is inserted into PCMCIA slot no. 0.

Free up memory to serve as additional program space when the application is on the PCMCIA card (slot no. 0). In this case, the data storage memory card is inserted into PCMCIA slot no. 1 (although the memory card in slot no. 0 can still be used for some of the data).

Unity<sup>™</sup> Pro programming software helps the application designer to manage the structure and organize how the memory space on the Premium PLC is occupied.

### Protecting the application

Regardless of the PLC memory structure (whether the application is located in the internal RAM or on the PCMCIA card), it is possible to prevent the application from being accessed (for the purpose of reading or modifying the program) by only loading the executable code into the PLC.

A memory protection bit, set in configuration mode, is also available to prevent any program modification (via the programming terminal or downloads).

### Program modification in online mode

This function is different from previous versions of Modicon® Premium<sup>™</sup> PLCs (with PL7 software) in that it now allows program code and data from different parts of the application to be added or modified in a single modification session (thus making modification unified and consistent with regard to the controlled process).

This increased flexibility comes at a cost in terms of the amount of program memory required. In order for the program to be modified in online mode, the amount of program memory space available must be at least equal to the combined size of the sections of the Unity Pro program affected by the single modification session concerned.

### Depending on circumstances:

■ In the case of a processor with a memory extension card, there will be sufficient memory left on the card for online modification, provided that the recommendations on page 1/22 are observed.

■ In the case of a processor without a memory extension card, if the user wants to be able to make modifications in online mode, he or she must select a processor on the basis of the following:

- □ The anticipated size of the application
- □ The number and size of the program sections to be modified in online mode

Note: A memory extension card based exclusively on Flash EPROM technology (without additional SRAM) is clearly incapable of supporting online program modifications.

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Unity<sup>™</sup> processors

Modicon® Premium™ PLCs have been developed to comply with major national and international standards on electronic industrial automation equipment. See pages 9/8 to 9/19 "Standards, certification and environmental conditions".

Product supplied with a multilingual Quick Reference Guide.
 Maximum number of TSX RKY 4EX/6EX/8EX racks (4, 6 or 8 slots). Using the TSX RKY 12 EX rack (12 slots) is the same as using 2 racks with 4, 6 or 8 slots.
 Fieldbus: INTERBUS or Profibus DP.

(4) The TSX CUSB485 converter requires the use of cable TSX CRJMD 25 (length 2.5 m, equipped with1 mini-DIN connector and 1 RJ45 connector).

## Presentation

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform PCMCIA memory extension cards

1

PCMCIA SRAM memory card

PCMCIA Flash EPROM memory card

### Presentation

PCMCIA memory extension cards are used to extend the internal RAM capacity of Modicon<sup>®</sup> Premium<sup>™</sup> processors.

Some of the cards can also be used on Modicon<sup>®</sup> Quantum<sup>™</sup> and Micro<sup>™</sup> processors. Depending on the model, these cards can host:

- Application program, symbols and constants
- Additional application data
- Or both

Unity™

### PCMCIA memory extension cards

The cards are inserted into PCMCIA slot no. 0 on Premium processors, i.e.:

- The upper slot on processors
- The internal slot on slot PLCs

Two of these SRAM data storage memory cards can also be inserted into slot no. 1, i.e.:

- The lower slot on processors
- The external slot on slot PLCs

These cards support three types of data storage:

■ Application storage: Program, symbols and constants in a common space (128 Kb

- to 7168 Kb, depending on the card model):
- □ TSX<sup>™</sup> MRP P●●●K for SRAM memories
- □ TSX<sup>™</sup> MFP P●●●K/M for Flash EPROM memories

■ Storage of the application and additional data, with 192 Kb to 7 Mb of application space and 7 Mb to 0 Kb of data storage space for additional data. The limit between these 2 spaces is configurable. The configurable cards are:

- □ TSX MRP CoooK/M for SRAM memories
- □ TSX<sup>™</sup> MCP C●●●K/M for Flash EPROM and SRAM memories

■ Storage of additional data, provided by 4 Mb or 8 Mb TSX MRP F00●M SRAM memory cards

These cards use 2 technologies:

### Battery-backed SRAM

Used in particular in the creation and debugging phases for the application program. These cards support:

- □ The application's transfer and modification services in online mode
- □ Additional data storage

The memory is backed up by a removable battery integrated into the PCMCIA card. A second auxiliary battery is present to enable the main battery to be replaced without loss of data.

### Flash EPROM

Used once debugging of the application program is complete. It enables:

- □ Backup battery life restrictions to be overcome
- □ A global application transfer to be performed

If it is used, the application cannot be modified in online mode.

#### Program modification in online mode

Only extension cards on which the program is stored in SRAM memory (TSX MRP PeeeK/M and TSX MRP CeeeK/M) support online program modification.

Users of processors fitted with memory extension cards who wish to modify or add program data in online mode must follow the two recommendations below:

Structure the application program in a number of sections of a reasonable size

Where possible, select one of the two extension cards recommended in the table below:

Modicon <sup>®</sup> Premium <sup>™</sup> processors	TSX <sup>™</sup> P57 0●		TSX P57 2• TSX PCI 57 2•	TSX P57 3• TSX PCI 57 3•	TSX P57 4•	TSX P57 5•	TSX P57 6•

### **PCMCIA** memory extension cards

Premium processors support the memory extension cards listed below. There are two types of memory limit:

- One associated with the type of processor or slot PLC (see above)

One associated with the model of PCMCIA memory card selected

The lowest of these two limits defines the memory capacity available to the user for his/her application.

Use on processor	Slot	Memory size		Reference	Weight

1/31

(7) The TSX P57 153M processor does not support the CANopen bus PCMCIA module.
 (8) The integrated Ethernet port requires one of the available network connections.
 (9) Processor reserved for updating configuration with TSX P57 352M PL7 processor (old version)

Processor can be migrated from PL7 to Unity Pro by means of a simple update of the processor's operating system (included on the Unity Pro software CD-ROM).

O New feature

TSX P57 4823AM (8)

### Modicon<sup>®</sup> Premium<sup>™</sup> automation platform PL7<sup>™</sup> processors

### Presentation

Premium<sup>™</sup> **TSX<sup>™</sup> P57 ●●3M/3AM** and **TSX P57 ●●23M/23AM** automation platform processors manage the entire PLC station, and are comprised of discrete I/O modules, Preventa<sup>™</sup> machine safety modules, analog I/O modules, and application-specific modules, that can be distributed over one or more racks connected via Bus X or a fieldbus.

### **TSX P57 processors**

The types of processor available are divided into different capacities according to memory, in-rack I/O, communication, and processing speed. According to the model: 4 to 16 racks

- 512 to 2040 discrete I/O
- 24 to 256 analog I/O

8 to 64 application-specific channels: Each application-specific module (counter, motion control, serial link or weighing) accounts for 1 or a number of application-specific channels

■ 1 to 4 networks (Ethernet, Fipway<sup>®</sup>, Ethway<sup>™</sup>, Modbus Plus<sup>™</sup>), 2 to 8 AS-Interface<sup>®</sup> sensor/actuator buses, 1 to 2 fieldbuses (CANopen, INTERBUS<sup>®</sup>, Profibus DP<sup>™</sup>), 0 or 1 Fipio fieldbus, serial links (Modbus<sup>®</sup>, Uni-Telway<sup>™</sup>)

■ 10 to 20 process control channels

#### Integrated communication

According to the model, Premium processors include:

- A 10 or 100 Mbit/s Ethernet Modbus/TCP port (RJ45 connection)
- A 1 Mbit/s Fipio bus link (bus manager)

■ Communication via 2 terminal ports (TER and AUX) using Uni-Telway or character mode protocol (typically a 19 or 115 Kbit/s programming terminal and an operator dialog terminal)

Each processor has a slot for a type III PCMCIA card that can accommodate a network card (Fipway, Modbus Plus), bus (CANopen (1), Fipio Agent) or serial links (Modbus, Uni-Telway, character mode).

#### Application design and installation

Different software licences are available for PL7<sup>™</sup> Junior/Pro version V4.5 depending on requirements:

■ Single-station

Multistation in the form of independent local stations (Junior/Pro), remote stations connected to a server via a network (Pro OpenTeam for 3 to10 stations or Pro OpenSite for more than 10 stations).

These licences are compatible with PC terminals running Windows 2000 Professional® or Windows XP® operating systems.

#### Configurations with TSX P57 351/352M processor

The TSX P57 353LAM single-format processor is intended as a replacement for the old version TSX P57 351M/352M processors.

### Migration of Modicon<sup>®</sup> Premium<sup>™</sup> processors

Some Premium **TSX P57 ●•3M/3AM** processors that are compatible with PL7 software can be migrated for compatibility with the Unity Pro<sup>™</sup> software without the need for hardware modifications. This migration from PL7 to Unity Pro is achieved by means of the following software updates:

- Processor operating system
- Integrated Ethernet port operating system

This update is carried out using the OS-Loader tool, included in Unity Pro (see page 6/27). Once migrated, PL7 processors are equivalent to corresponding Unity processors.

The following PL7 processors can be migrated to Unity Pro (software migration): ■ TSX 57 2•: TSX P57 203/253/2623M become

TSX P57 204/254/2634M respectively

■ TSX 57 3•: TSX P57 303/353/3623AM become

TSX P7 304/354/3634M respectively (migration supported by Unity Pro version ≥ 3.0).

**Note:** Processor migration requires the use of new PCMCIA TSX MRP P/C, TSX MFP P/C memory references. See the equivalence table on page 1/32.

(1) Not with TSX P57 153M processor.

## Presentation (continued), description

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform

PL7<sup>™</sup> processors

### Presentation (continued)

#### Migration of Modicon<sup>®</sup> Premium<sup>™</sup> processors (continued)

Migration offers involving the replacement of the processor are available for other product references. Please contact your Regional Schneider Electric Sales Office for more information about these offers. They are only available for a limited period of time, and include the following PL7<sup>™</sup> processors:

- TSX<sup>™</sup> P57 2823M for migration to TSX P57 254M with TSX ETY 4103 (1)
- TSX P57 453AM for migration to TSX P57 454M
- TSX P57 453AM for migration to TSX P57 554M
- TSX P57 4823AM for migration to TSX P57 4634M
- TSX P57 4823AM for migration to TSX P57 5634M
- TSX P57 4823AM for migration to TSX P57 454M with TSX ETY 4103 (1)
- TSX P57 4823AM for migration to TSX P57 554M with TSX ETY 4103 (1)

### Description

#### Processors without integrated Ethernet port

Single-format TSX P57 1•3M/353LAM processors and double-format

**TSX P57 2•3M/3•3AM/453AM** processors feature the following on the front panel: 1 A display block with 5 LEDs:

□ RUN LED (green): Processor in operation (program running)

□ ERR LED (red): Controller detected fault on the processor or its on-board devices (PCMCIA memory card and PCMCIA communication card)

- □ I/O LED (red): Controller detected fault occurring on another station module or configuration fault
- □ TER LED (yellow): Activity on the terminal port
- □ FIP LED (red): Activity on the integrated Fipio bus
- 2 RESET button causing a cold restart of the PLC when it is activated
- 3 An 8-way female mini-DIN connector marked TER for connecting a programming
- or adjustment terminal
- 4 An 8-way female mini-DIN connector marked AUX for connecting a peripheral device
- 5 A PCMCIA slot (no. 0) for a memory extension card
- 6 A PCMCIA slot (no. 1) for a communication card or 4 Mb SRAM memory extension card for storing additional data
- 7 A 9-way SUB-D connector (on TSX P57 153/253M, TSX P57 353 LAM and TSX P57 353/453AM models) for Fipio bus manager communication

### **Processors with integrated Ethernet port**

Double-format **TSX P57 2623/2823M** and **TSX P57 3623AM/4823AM** processors with integrated Ethernet port feature the following on the front panel:

- 1 A display block with 5 LEDs:
- □ RUN LED (green): Processor in operation (program running)
- □ ERR LED (red): Controller detected fault on the processor or its on-board devices (PCMCIA memory card and PCMCIA communication card)

□ I/O LED (red): Controller detected fault occurring on another station module or configuration fault

- □ TER LED (yellow): Activity on the terminal port
- □ FIP LED (red): Activity on the integrated Fipio bus
- 2 A display block relating to the integrated Ethernet port featuring 5 LEDs:
- □ RUN LED (green): Ethernet port ready
- □ ERR LED (red): Ethernet port inoperative
- COL LED (red): Collision detection
- □ STS LED (yellow): Ethernet link diagnostics
- □ Two TX and RX LEDs (yellow): Transmission/reception activity
- 3 RESET button causing a cold restart of the PLC when it is activated
- 4 An 8-way female mini-DIN connector marked TER for connecting a programming or adjustment terminal
- 5 An 8-way female mini-DIN connector marked AUX for connecting a peripheral device
- 6 An RJ45 connector for connection to the Ethernet network
- 7 A PCMCIA slot (no. 0) for a memory extension card
- 8 A PCMCIA slot (no. 1) for a communication card or 4 Mb SRAM memory extension card for storing additional data
- 9 A 9-way SUB-D connector (on TSX P57 2823M/4823AM models) for Fipio bus manager communication

(1) The TSX ETY 4103 Ethernet Modbus/TCP module offered features the same functions as the integrated Ethernet port on TSX P57 2823M/4823AM processors. However, the combined processor and Ethernet module use one slot more than the PL7 processor to be migrated. Therefore, this type of migration requires a free slot in the Premium rack and modification of the converted Unity Pro application.

TSX P57 1•3M

TSX P57 2•3M TSX P573•3AM/45

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform PL7<sup>™</sup> processors

Modicon<sup>®</sup> Premium<sup>™</sup> PLCs have been developed to comply with major national and international standards on electronic industrial automation equipment. See pages 9/8 to 9/19 "Standards, certification and environmental conditions".

The remote I/O on the bus or network (CANopen, AS-Interface, Uni-Telway, Fipio, Modbus Plus, etc.) or fieldbus (INTERBUS or Profibus DP) are not included in these maximum numbers.

(2) The second value applies if PL7 Junior/Pro programming software V4.4 or higher is used.
 (3) The first value applies to the single-format TSX P57 353LAM processor and the second to the double-format TSX P57 353AM processor.

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform PL7<sup>™</sup> processors

Application data (30.5 Kwords max.)

Processor with PCMCIA card

Task descriptor and executable code

3 Constant words, initial values and configuration

Application data (30.5 Kwords max.)

Task descriptor and executable code

Constant words, initial values and configuration

Depending on the model of PCMCIA card

### **Memory structure**

The application memory is divided into memory areas that are physically distributed across the internal RAM memory and the PCMCIA memory extension card(s):

The application data area is always in the internal RAM.

■ The application program area is in the internal RAM or the PCMCIA memory card. ■ The constants area is in the internal RAM or the PCMCIA memory card.

There are two ways of organizing the application memory for

TSX<sup>™</sup> P57 1•3/2•3/2•23M and TSX P57 3•3/3623/453/4823AM processors with or without a memory extension installed in the form of a PCMCIA format card:

### Application in internal RAM

The application is completely loaded into the processor's battery-backed internal RAM (1). The capacity depends on the processor model (32 to 96 Kwords).

For example, the TSX P57 1•3M processor has 7.5 Kwords of application data and 24.5 Kwords of program, constants and system data (2).

The memory space (32 Kwords) is shared between the application data, the program, the constants and the system data (2).

### Application in the PCMCIA card (slot no. 0)

The internal RAM is reserved for the application data. The PCMCIA card contains the program and constants (64 to 512 Kwords). The file storage area of 128 K or 640 Kwords (depending on the model of PCMCIA card) can be used in remote applications, for storing production data information,

recipes etc The symbols storage area of 128 K or 256 Kwords (depending on the model of PCMCIA card) enables the application symbols database to be stored on the PLC.

### Extension of the additional data storage area (slot no. 1)

This area, containing 128 or 640 Kwords, can be extended up to 2688 Kwords by using an SRAM TSX MRP DS 2048P/MFP 004MPCMCIA memory card. This card is inserted into the lower slot on TSX P57 2e3/2e23M, TSX P57 3e3/3623/453/4823AM processors and can be used in conjunction with memory extension cards (type 1 in the upper slot).

### Data in internal RAM

The data area can be extended to up to 30.5 Kwords. It is only supported by the PLC's internal RAM.

PL7<sup>™</sup> Junior/Pro software helps the application designer to manage the structure and organize how the memory space on the Premium PLC is occupied.

### Protecting the application

Schneider

Regardless of the PLC memory structure (whether the application is located in the internal RAM or on the PCMCIA card), it is possible to protect the application so that it cannot be accessed (for the purpose of reading or modifying the program) in online mode under PL7 Junior/Pro.

A memory protection bit, set in configuration mode, is also available to prevent any program modification (via the programming terminal or downloading).

### Modicon<sup>®</sup> Premium<sup>™</sup> processor references

TSX 57 10/20/30/40 processors are equipped with:

A PCMCIA slot (no. 0) that can accommodate a memory extension or SRAM memory card for the purpose of storing additional data

A PCMCIA slot (no. 1) that can accommodate a communication card or memory card for the purpose of storing additional data

Two terminal ports (8-way female mini-DIN type), Uni-Telway or character mode. TSX 57 processors are double-format modules (except TSX P57 1•3M and TSX P57 353LAM processors, which are single-format).

TSX 57 30/40 processors support the loading of programs, via the terminal port, at a maximum speed of 115 Kbit/s (limited to 19.2 Kbit/s for TSX 57 10/20 processors). The integrated Fipio® link (bus manager) on TSX 57 20/30/40 processors supports a

maximum of 127 connection points. The link on the TSX P57 153M processor is limited to 63 connection points.

(1) The internal RAM is protected by an optional battery with a life of 3 years. The battery is located in the power supply module.

(2) The system has a minimum reserve RAM memory area in the order of 5 Kwords. Please refer to the PL7 Micro/Junior/Pro reference manual.

### **PCMCIA** memory extension cards

Premium processors can support up to 2 memory extension cards. However, useful memory capacity is limited to the maximum size defined for the processor model.

References, see pages 1/32 and 1/33.

- (1) Cumulative maximum values. The number of remote I/O on the bus is not included.
- (2) Maximum number of TSX™ RKY 4EX/6EX/8EX racks (4, 6 or 8 slots). Using the TSX™ RKY 12EX rack (12 slots) is the same as using 2 racks with 4, 6 or 8 slots.
- (3) Using the CANopen bus reduces the number of possible fieldbuses (INTERBUS®/Profibus DP™) by 1.
- (4) The second value corresponds to the integrated memory capacity when the processor is equipped with a PCMCIA (5) Single-format processor for TSX<sup>™</sup> P57 353LAM, double-format processor for TSX P57 353AM.
- (6) 992 Kwords with PL7 Junior/Pro software V4.4 or higher.
   (7) 3 networks with TSX P57 4823AM processor.

PCMCIA memory extension cards PL7™

PCMCIA Flash EPROM memory

PCMCIA SRAM memory

SRAM memory extension (slot no. 0)

### Presentation

PCMCIA memory extension cards are used to extend the internal RAM capacity of Premium processors. Depending on the model, these cards are designed to:

- Receive the application program and constants
- Store additional application data and/or various application object symbols

### Offer for Modicon<sup>®</sup> Premium<sup>™</sup> platform under PL7<sup>™</sup>

As of November 2004, the old TSX™ MRP/MFP ●●●P PCMCIA memory extension cards offer, which was specifically for Premium processors under PL7, was replaced by a new offer. This offer includes (1):

- TSX Micro<sup>™</sup> PLCs under PL7
- Premium processors under Unity<sup>™</sup> Pro and PL7
- Modicon<sup>®</sup> Quantum<sup>™</sup> processors under Unity Pro

The table below indicates equivalences between the old and new versions. There may be one or more new references corresponding to each old reference depending on whether migration from PL7 to Unity Pro is envisaged.

Schneider Gelectric

(1) With the exception of TSX MFP 064P2/0128P2 Flash EPROM memory cards for use with PL7 processors.

(2) Selection based on the size of the PL7 program memory in relation to the size of the data storage memory.

(3) If symbols do not need to be stored on the PCMCIA.

(4) If additional data does not need to be stored on the PCMCIA.

(5) Memory card compatible with processor version ≥ 5.5.

PCMCIA memory extension cards

### Presentation (continued)

PCMCIA memory extension cards

Memory cards (with the exception of **TSX**<sup>™</sup> **MRP P004M** and *TSX MRP DS 2048P* for additional SRAM data storage) are inserted into PCMCIA slot no. 0 on Modicon<sup>®</sup> Premium<sup>™</sup> processors (upper slot). The **TSX<sup>™</sup> MRP F004M**/*TSX MRP DS 2048P* additional data storage card is inserted into slot no. 1 only on Premium processors (lower slot).

With  $PL7^{T}$ , these cards support four different types of storage:

Application storage: Program and constants in a common area of between 64 and 512 Kwords, in the SRAM or Flash EPROM memory.

Application and additional data storage, comprising an application area of between 64 and 384 Kwords and a data storage area of 128 or 640 Kwords designed for additional data, in the SRAM or Flash EPROM and SRAM.

Application, additional data and symbol storage, comprising an application area of between 32 and 512 Kwords, a data storage area of 128 or 640 Kwords designed for additional data, and a symbols area of 128 or 256 Kwords, in the SRAM or Flash EPROM and SRAM.

Additional data storage provided by an SRAM with a capacity of 2 M words.

These cards use 2 technologies:

Battery-backed SRAM. Used in particular in the creation and debugging phases for the application program. These cards support application transfer and modification services in online mode and the storage of additional data.

The memory is backed up by a removable battery integrated into the PCMCIA card. A second, auxiliary battery, provides backup so that the main battery can be replaced without data being lost.

• Flash EPROM. Used once debugging of the application program is complete. It enables restrictions in terms of the service life of backup batteries to be avoided and supports global application transfer. If a Flash EPROM is used, the application cannot be modified in online mode.

#### References

If future migration from PL7<sup>™</sup> to Unity<sup>™</sup> Pro is envisaged, see the equivalence table opposite for the new equivalent reference.

Power supply and fan modules

TSX PSY 2600M

TSX PSY 5500M

### **Description of power supply modules**

TSX<sup>™</sup> PSY●●●0M power supply modules provide the power supply for each rack and the modules installed on it.

The power supply module is selected according to:

- $\blacksquare$  The mains electrical supply: == 24 V, == 24...48 V,  $\sim$  100...120,  $\sim$  200...240 V
- The required power: standard format or double format model, see power consumption table on page 9/6.

TSX PSY ••• 0M power supply modules are comprised of:

- 1 Display block comprising:
- □ OK lamp (green), on if voltages are present and correct.
- BAT lamp (red), on if the battery is inoperative or missing.
- □ 24 V lamp (green), on when the sensor voltage is present (according to model).
- 2 RESET pencil-point pushbutton causing a warm restart of the application.
- 3 Slot for a battery that protects the internal RAM memory of the processor.
- 4 Cover to protect the front panel of the module.
- **5** Screw terminal for connecting:
- To mains supply.
- □ The alarm relay contact. □ The sensor power supply for a.c. supplies (according to model).
- 6 Opening for cable clamp.
- 7 Fuse located beneath the module and protecting:
- □ 24 VR voltage on the non-isolated d.c. supply with TSX PSY 3610.
- □ Primary voltage on the other power supplies.
- 8 110/220 voltage selector (according to model).

### **Description of fan modules**

**TSX<sup>™</sup> FAN ●●P** fan modules installed above the racks of Modicon<sup>®</sup> Premium<sup>™</sup> PLCs provide forced air convection, in order to maintain an even ambient temperature inside the enclosure and to eliminate the various hot spots that may exist.

Fan modules are required whenever the ambient temperature is between 60 °C and 70 °C (forced ventilation enables the ambient temperature in the enclosure to be lowered by 10 °C) (1).

Three types of fan module are available:  $\pm$  24 V,  $\sim$  110 V and  $\sim$  220 V.

According to the modularity of the racks used:

- One fan module for a 4 or 6 position rack,
- Two fan modules for an 8 position rack,
- Three fan modules for a 12 position rack.

TSX FAN ●●P fan modules are comprised of:

- Connection terminal for the fan module power supply, the internal temperature probe and the associated LED or preactuator.
- 2 Ground terminal.
- 3 Two mounting holes for the fan module.
- 4 Shuttered air outlets.

(1) For an ambient temperature between 25 °C and 60 °C, the use of fan modules increases the MTBF.

When supplying modules with relay outputs, the range is reduced to 21.6...26.4 V.
 These values should be taken into account when starting several devices simultaneously and for sizing protection devices.
 Output - 24 V for supplying relays of modules with relay outputs.
 Output - 24 VR, cannot be accessed by the user and is protected by a fuse located beneath the module (5 x 20, 4 A, type Medium)
 77 W at 60 °C, 85 W at 55 °C, or 100 W at 55 °C using TSX FAN●●P fan modules.

# Modicon<sup>®</sup> Premium<sup>™</sup> automation platform

Power supply and fan modules

#### Functions Alarm relay

The alarm relay located in each power supply module has a volt-free contact that can be accessed on the connection screw terminal of the module.

The operating principle is as follows:

Module alarm relay located on the processor rack (rack 0): in normal operation, PLC in RUN, the alarm relay is activated and its contact is closed (state 1). Whenever the application stops, even partially:

- $\Box$  occurrence of a blocking condition
- □ incorrect output voltages
- □ loss of mains power,

the relay de-energizes and the associated contact opens (state 0).

■ Alarm relay of power supply modules located on other racks (racks 1 to 7): when the module is powered up and if the output voltages are correct, the relay is activated and its contact is closed (state 1). When the mains power is lost or if the output voltages are incorrect, the relay de-energizes (state 0).

#### **Back-up battery**

Each power supply module has a slot reserved for a battery that provides the power supply to the internal RAM memory located in the processors, in order to help ensure that data is saved when the PLC is switched off. The duration of data back-up is one year. The battery must be changed as soon as the BAT lamp (red) on the front panel lights up.

#### **RESET** pushbutton

Pressing this pushbutton, on the front panel of the power supply module, triggers a sequence of service signals that is the same for:

- A power break when the pushbutton is pressed
- A power up when the pushbutton is released

These operations are expressed by the application as a warm restart.

#### Sensor power supply .... 24 V

The TSX<sup>™</sup> PSY 2600M/5500M/8500M a.c. power supply modules have an integrated power supply that provides a voltage of ---- 24 V to supply the input sensors. Connection to this sensor power supply can be accessed via the module screw terminal. The available power on ---- 24 V depends on model (0,5/0,8/1,6 A), see characteristics page 2/3.

### References, dimensions. mounting

### Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Power supply and fan modules

#### References

Each TSX™ RKY ●/●EX rack must be equipped with a single or double format power supply module (slot marked PS).

The power required to supply each TSX RKY rack depends on the type and number of modules installed in the rack. It is therefore necessary to establish a power consumption table rack by rack in order to determine the TSX PSY power supply module most suitable for each rack (see pages 9/6 and 9/7).

Single rack configuration

#### Presentation

TSX™ RKY ●● racks form the basic elements of the Premium control system platform with a single rack (6, 8 or 12 positions).

These non extandable racks provide the following functions:

- Mechanical function: they enable the modules of a PLC station (power supply,
- processor, discrete I/O, analog I/O, application-specific modules) to be fitted. Electrical function: they enable connection to the bus (bus X) and provide
- distribution of: They enable connection to:
- power supplies required for each module in the same rack,
- □ data and service signals for the entire PLC station where this has several racks.

TSX<sup>™</sup> FAN ●●P fan modules installed above the racks of Premium PLCs provide forced air convection, in order to maintain an even ambient temperature inside the enclosure and to eliminate the various hot spots that may exist (see page 2/2).

#### Description

- TSX RKY •• non-extendable racks are comprised of:
  - Metal frame.
- 2 Slots for anchoring the module pins.
- 3 48-way female 1/2 DIN connectors for module-rack connections (the first connector is reserved for the power supply module).
- Locating slot for the power supply module. 4
- Tapped holes for fixing the module. 5
- Four holes for mounting the rack. 6
- 7 Position for rack address label.
- 8 Position for station network address label.
- 9 Two ground terminals for grounding the rack.

### Presentation

# Modicon<sup>®</sup> Premium<sup>™</sup> automation platform

Multi-racks configuration without remote module

#### **Composition of a PLC station**

Using 1 TSX<sup>™</sup> RKY 4EX/6EX/8EX/12EX (1) extendable racks, a PLC station can be constituted which is comprised of up to:

- 4 racks for a station with TSX 57 10 Premium<sup>™</sup> processor,
- 16 racks for a station with TSX 57 20, 57 30, 57 40, 57 50 Premium<sup>™</sup> processor. The racks are connected to each other by bus X extension cables 2.

#### Bus X

The racks distributed on bus X are connected to each other via bus X extension cables whose total length is 100 m maximum. Using **TSX REY 200** bus X remote modules enables the length of bus X to be increased to a maximum of 2 x 350 m (see 2/12).

The racks are connected to each other using **TSX CBY** ••0K bus X extension cables which are connected to one of the two 9-way SUB-D connectors on each extendable rack. The incoming cable from another rack can be connected to either the right 4 or left-hand 3 connector.

Line terminations

The two extendable racks located at the ends of the line must have a TSX TLY EX line terminator 5 fitted on the unused 9-way SUB-D type connector.

#### **Presentation of extentable racks**

TSX RKY ●●EX racks form the basic elements of the Modicon<sup>®</sup> Premium<sup>™</sup> control system platform. These racks provide the following functions:

Mechanical function: they enable the modules of a PLC station (power supply, processor, discrete I/O, analog I/O, application-specific modules) to be fitted.
 Electrical function: they enable connection to the bus (bus X) and provide

distribution of: □ power supplies required for each module in the same rack,

data and service signals for the entire PLC station where this has several racks.

To meet user requirements, several types of rack are available in order to make up PLC stations comprising 1 to 16 racks maximum distributed over bus X with a maximum cumulative length of 100 meters.

**TSX FAN** ••**P** fan modules installed above the racks of Premium PLCs provide forced air convection, in order to maintain an even ambient temperature inside the enclosure and to eliminate the various hot spots that may exist (see page 2/2).

(1) Using the TSX RKY 12EX (12 slots) is the same as occupying 2 racks with 4, 6 or 8 slots.

## Description, functions

# Modicon<sup>®</sup> Premium<sup>™</sup> automation platform

Multi-racks configuration without remote module

#### TSX<sup>™</sup> RKY ●●● racks are comprised of:

- Metal frame.
- 2 Slots for anchoring the module pins.
- 48-way female 1/2 DIN connectors for module-rack connections (the first 3 connector is reserved for the power supply module).
- Locating slot for the power supply module. 4
- 5 Tapped holes for Mounting the module.
- 6 Four holes for mounting the rack.
- 7 Position for rack address label.
- 8 Position for station network address label.
- 9 Two ground terminals for grounding the rack.
- 10 Microswitches for coding the rack address (on extendable racks).
- 11 Two 9-way female SUB-D connectors for the remote connection of bus X to another extendable rack.

"less-significant" ίœ 61 02 03

address 0 with double format power supply and

standard format

Extension rack

address n with double format power

supply

processor

#### **Rack addresses**

Address 0: this address is always assigned to the rack which holds the processor. This rack can be located in any position on the line.

Addresses 1 to 7: these can be assigned in any order to the other extendable racks of the station

As the two racks with 4,6, or 8 slots which make up each pair can have the same address on the bus X, position numbers are defined as follows:

Rack n "less-significant": position 00 to xx (02, 04 or 06); rack n "most-significant": position 08 to yy (10, 12 or 14).

Each rack with 12 slots holds an address (with position 00 to 10).

#### Installing the various modules on the standard or extendable rack with address 0

The rack with address 0 must contain a power supply module and the processor module. For Modicon<sup>®</sup> Premium<sup>™</sup> PLCs which have two types of power supply (standard or double format), the position of the processor (standard or double format) will depend on the type of power supply used.

- Using a standard format power supply module:
- The power supply module systematically occupies position PS.
- The processor module must be installed in position 00/01 (00 with standard format processor).
- The other modules are installed from position 02 (01 with standard format processor).
- Using a double format power supply module:
- The power supply module systematically occupies positions PS and 00.
- The processor module must be installed in position 01/02 (01 with standard format processor).

■ The other modules are installed from position 03 (02 with standard format processor).

#### Installing the various modules on extendable racks with addresses 1 to 7

Each rack must have either a standard format or double format power supply module.

- Using a standard format power supply module:
- The power supply module systematically occupies position PS.
- The other modules are installed from position 00 onwards.

Using a double format power supply module:

- The power supply module systematically occupies positions PS and 00.
- The other modules are installed from position 01 onwards.

Multi-racks configuration with remote module

#### Presentation

Bus X for Modicon<sup>®</sup> Premium<sup>™</sup> PLCs can be used to connect eight 12 position racks or sixteen 4, 6 or 8 position racks, distributed over a maximum length of 100 meters (2/9).

For applications requiring longer distances between racks, the bus X remote rackmaster module: **TSX<sup>™</sup> REY 200** can be used to increase this distance up to a maximum of 350 meters without reducing performance.

The bus X remote system is electrical. Using the bus X remote rackmaster module will not result in any loss of performance in reading or controlling I/O. The bus X remote system is comprised of:

One TSX REY 200 module called the "master" 1 located on the rack at address 0 (rack supporting the processor 2 and the main bus X 3). This module has 2 channels used to locate 2 bus X segments 5 remotely at a maximum distance of 250 meters.
 One or two TSX REY 200 modules 4 called "slaves" located on each extendable rack.

■ Each slave module is connected to the master module by a **TSX CBRY 2500** cable **5**, which the user should cut and fit with **TSX CBRY K5** connectors as required (cabling does not require any special equipment).

Each end of the bus should be fitted with a TSX TLY EX line terminator 6.

#### Implantation rules

The rules for installing the bus X remote rackmaster module, **TSX REY 200**, are as follows :

■ Bus X remote rackmaster module acting as a master. It is installed on the rack at address 0 supporting the processor with :

□ The power supply module systematically occupying position(s) PS (and 00). The processor module must be installed in position 01 (and 02 if it is a double format processor).

□ The bus X remote rackmaster module, **TSX REY 200**, can be installed in any position after 02 (or 03 if it is a double format processor).

■ Bus X remote rackmaster module acting as a slave. It is installed in an extendable rack (located on an extendable bus X segment) in any position apart from the positions dedicated to the power supply module.

#### Description

The front panel of the bus X remote rackmaster module TSX REY 200 is comprised of:

- 1 A display block with 6 indicator lamps:
- □ RUN indicator: module running
- ERR indicator: module has detected an internal fault
- □ I/O indicator: module has detected an external fault
- □ MST indicator: module acting as master or slave

□ CH0 indicator: channel 0 operating

- □ CH1 indicator: channel 1 operating
- 2 5-way SUB-D 9 connector for the connection of channel 0.
- 3 5-way SUB-D 9 connector for the connection of channel 1.

### Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Discrete I/O modules

Connecting modules with screw terminal blocks

Discrete I/O module terminal blocks have a device for automatically transferring the coding when first used. This prevents manipulation errors when a module is replaced. This coding helps to ensure electrical compatibility for the type of module. Each terminal can accept bare wires or wire with cable ends with open tags.

- The capacity of each terminal is:
- Minimum: 1 x 0.2 mm<sup>2</sup> wire (AWG 24) without cable end.

• Maximum:  $1 \times 2 \text{ mm}^2$  wire (AWG 14) without cable end or  $1 \times 1.5 \text{ mm}^2$  wire (AWG 15) with cable end.

Screw connection terminal blocks are equipped with captive screws.

The maximum terminal block capacity is 16 x 1 mm<sup>2</sup> (AWG 17) wires + 4 x 1.5 mm<sup>2</sup> (AWG 15) wires.

#### **Connecting modules with HE 10 connectors**

#### Preformed cable with 20 wires, AWG 22-gauge (0.324 mm<sup>2</sup>)

Used for simple and direct wire to wire connection of the I/O of the module with connectors 1 to the sensors, preactuators or terminals.

This preformed cable 3 is comprised of:

■ An insulated HE10 2 connector at one of the ends, with 20 x 0.34 mm<sup>2</sup> cross-section sheathed wires.

■ At the other end 4, flying leads differentiated by a color code conforming to standard DIN 47100.

TSX CDP 301: 3 meters long, TSX CDP 501: 5 meters long, TSX CDP 1001: 10 meters long.

#### Rolled ribbon cable with sheath, AWG 28-gauge (0.08 mm<sup>2</sup>)

Used for connecting I/O of modules with HE 10 connectors 1 to Advantys<sup>™</sup> Telefast® ABE 7 fast wiring 2 connection and adaptation interfaces. This cable 3 has 2 HE 10 connectors 4 and a rolled ribbon cable with sheath with 0.08 mm<sup>2</sup> cross-section wires.

Given the small cross-section of the wires, it is recommended for use with low current I/O only (100 mA maximum per output).

TSX CDP 102: 1 meter long, TSX CDP 202: 2 meters long, TSX CDP 302: 3 meters long.

#### Connection cable, AWG 22-gauge (0.324 mm<sup>2</sup>)

Used for connecting the I/O of modules with HE 10 connectors 1 to Advantys Telefast ABE 7 fast wiring 2 connection and adaptation interfaces. This cable 5 has 2 insulated HE 10 connectors 6 and a cable for carrying higher currents (500 mA maximum).

TSX CDP 053: 0.5 meters long, TSX CDP 103: 1 meter long, TSX CDP 203: 2 meters long, TSX CDP 303: 3 meters long, TSX CDP 503: 5 meters long. TSX CDP 1003: 10 meters long.

Rolled ribbon and connection cable

### Principle (continued), description

# Modicon<sup>®</sup> Premium<sup>™</sup> automation platform

Discrete I/O modules

#### Connection to Tego® Dial and TeSys® Quickfit systems

TSX<sup>™</sup> DEY 16FK/32D2K/64D2K input modules and TSX<sup>™</sup> DSY 32T2K/64T2K output modules 1 are specially designed for use in conjunction with Tego Dial and TeSys Quickfit systems (1).

The modules are easily connected using a TSX<sup>™</sup> CDP ●●3 connecting cable 2 to the Dialbase sub-base APE 1B24M 3 installed on the Dialpack terminal 4 equipped with a panel 5 which enables operator dialog.

(1) See pages 3/42 to 3/45

#### Description

Discrete I/O modules are standard format (1 slot). They have a plastic case which helps to ensure IP 20 protection of the electronics.

#### I/O modules with screw terminal connection

- 1 A display block for channels and module diagnostics. 2 A removable screw terminal for direct connection of the I/O to the sensors and
- preactuators, TSX<sup>™</sup> BLY 01 (connectors to be ordered separately). A pivoting cover for accessing the terminal block screws and holding the 3 identification label.
- 4 A rotating support containing the module locating device.

#### I/O modules with connection via HE 10 connector

- 1 A display block for channels and module diagnostics.
- 2 HE 10 connectors, protected by a cover. They are used to connect the I/O to sensors and preactuators either directly, or via Advantys<sup>™</sup> Telefast<sup>®</sup> ABE 7 connection sub-bases.

# Modicon<sup>®</sup> Premium<sup>™</sup> automation platform

Discrete I/O modules

#### **Functions**

#### I/O assignment

Each module is functionally organized into groups of 8 channels. Each group of channels can be assigned a specific application task.

#### Reactivation of outputs

If a module detected fault has caused an output to trip, the output can be reactivated if no other terminal condition is present. The reactivation command, defined during configuration, can be automatic (reactivation every 10 seconds) or controlled via the program. Reactivation is carried out in groups of 8 channels. This function can be accessed on modules with solid state d.c. outputs. For relay and triac output modules protected by fuse, the same type of reactivation (automatic or via program) is necessary after replacement of one or more fuses.

#### **RUN/STOP** command

An input can be configured to control the RUN/STOP mode for the PLC. The command is accepted on a rising edge. A STOP command via an input takes priority over a change to RUN via the terminal or via a network command.

#### Output fallback

When an application is placed in STOP mode, outputs must be set to a state which is not harmful to the application. This state, known as the fallback position, is defined for each module when its outputs are configured.

- This configuration enables the choice between:
- fallback: channels are set to state 0 or 1 depending on the fallback value entered.
- maintain: outputs retain the state they were in before the PLC stopped.

#### **Diagnostic functions**

■ module diagnostics: any potential hardware problem detected that would prevent normal operation of an output module or fast input module is signaled. Similarly, any module detected internal fault is signaled.

■ process diagnostics: sensor/pre-actuator voltage check, terminal block presence check, short-circuit and overload check, sensor voltage check, pre-actuator voltage check.

#### Specific functions of the TSX<sup>™</sup> DEY 16FK and TSX<sup>™</sup> DMY 28 FK module inputs

Latching: accepts particularly short pulses with a duration of less than the PLC scan time

Event input: enables events to be accepted and helps to ensure their immediate processing (processing on interrupt). These inputs are associated with event processing (EVTi) and defined in configuration mode where: i = 0 to 31, 0 to 63 or 0 to 128 depending on Premium processors model.

Event processing can be triggered on a rising edge  $(0 \rightarrow 1)$  or falling edge  $(1 \rightarrow 0)$  of the associated input. A masking/unmasking function for TSX DEY 16FK/DMY 28FK inputs is available in online mode.

Programmable input filtering: inputs are equipped with filtering which can be configured for each channel. Inputs are filtered by a fixed analog filter which helps ensure a maximum immunity of 0.1 ms for filtering line interference and by a digital filter which can be configured from 0.1 to 7.5 ms in increments of 0.5 ms.

#### Reflex and timer functions for the TSX DMY 28RFK module

Can be used to create applications which require a faster response time than the FAST task or event processing (< 500 [s). These control system functions are executed in the module and are independent of the PLC task. They are programmed using Unity<sup>™</sup> Pro or PL7<sup>™</sup> Junior/Pro software in configuration mode.

#### Removal when powered up

Due to their integrated devices, I/O modules (including application-specific modules) can be removed and connected while powered up.

### Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Analog I/O modules

#### Presentation

- Analog I/O modules for Modicon $^{\ensuremath{\circledast}}$  Premium $^{\ensuremath{\sim}}$  PLCs are equipped with :
- Either one 25-way SUB-D connector (TSX<sup>™</sup> AEY 420/800/810 and TSX<sup>™</sup> ASY 800)
- Or two 25-way SUB-D connectors (TSX AEY 1600/1614)
- Or a screw terminal block (TSX AEY 414, TSX ASY 410)

They can be installed in any position in TSX<sup>™</sup> RKY ●●● racks except for the positions reserved for power supply modules. Analog I/O modules can be removed while the PLC is powered up.

The maximum number of analog channels in a Premium configuration

(12...256 channels) depends on the processor used, see pages 1/10, 1/20 and 1/28.

#### Description

3

Connection using

SUB-D connector

The front panels of TSX AEY/ASY analog I/O modules include:

- 1 display and module diagnostics block.
- 2 connector for receiving the screw terminal block.
  - rotating support containing the module locating device.
- 4 removable screw terminal for direct connection of the I/O to the sensors and pre-actuators TSX BLY 01 (to be ordered separately).
- 5 pivoting cover for accessing the terminal block screws and holding the identification label.
- 6 rotating support containing the module locating device .
- 7 25-way SUB-D connector for connecting the sensors.

Note: The TSX ASY 800 modules have on the front panel a screw terminal for external 24 VR connection. See page 3/26

#### Connection principle for TSX<sup>™</sup> AEY/ASY modules with SUB-D connector

The Advantys<sup>™</sup> Telefast<sup>®</sup> ABE 7 pre-wired system simplifies the installation of modules by providing access to the inputs (or outputs) at the screw terminals. Connection is via a TSX CAP 030/100 3 or 10 m shielded cable equipped with SUB-D connectors at either end.

■ The Telefast ABE 7CPA02 sub-base enables 8 channels to be connected.

The Telefast ABE 7CPA03/31 sub-base enables the connection of 8 channels and:

□ provides channel by channel supply for 2 and 4-wire sensors with --- 24 V for sub-base **ABE 7CPA03**,

□ channel by channel isolated supply for 2 and 4-wire 24 V sensors for sub-base **ABE 7CPA31**,

□ helps ensure continuity of current loops when the SUB-D connector is removed, □ protects the current shunt within the modules against overvoltages.

■ The Advantys Telefast **ABE 7CPA12** sub-base enables 16 thermocouples to be connected with 2 **TSX CAP 030/100** cordsets. The terminal block is fitted with a temperature probe for cold junction compensation.

Connection using screw

### Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Analog I/O modules

#### TSX<sup>™</sup> AEY 420, 800/810, 1600 analog input modules

TSX AEY ••• modules are high level analog input modules with 4 inputs for the TSX AEY 420 module, 8 inputs for TSX AEY 800/810 modules and 16 inputs for the TSX AEY 1600 module.

Used with sensors or transmitters, they perform monitoring, measurement and process control functions for continuous processes.

Depending on the choice made during configuration, **TSX AEY 420/800/810/1600** modules offer the following ranges for each of their inputs  $\pm$  10 V, 0...10 V, 0...5 V, 1...5 V, 0...20 mA, 4...20 mA.

#### Functions

□ Scanning of input channels, protection against overvoltages, adaptation of signals by analog filtering, scanning by solid state multiplexing.

□ Adaptation to input signals: gain selection, drift compensation.

□ Digitisation of signals: 12-bit analog/digital conversion for **TSX AEY 800/1600** and 16 bit analog/digital conversion for **TSX AEY 420/810**.

Converting input measurements to user format: recalibration coefficient, filtering, scaling.

□ Module monitoring: conversion circuit test, range overshoot test, terminal block presence test, "watchdog" test.

□ Isolation of input channels on TSX AEY 810.

□ Fast processing of inputs (1 ms) on TSX AEY 420.

#### TSX<sup>™</sup> AEY 414/1614 analog input modules

The **TSX AEY 414** module is a multirange input module with 4 channels isolated from each other.

Depending on the choice made during configuration, the following ranges are available for each of its inputs:

■ thermocouples B, E, J, K, N, R, S, T, U or - 13...+ 63 mV electrical range.

■ 2 or 4-wire Pt 100, Pt 1000, Ni 1000 temperature probe, or ohmic range: 0...400 [], 0...3850 [].

■ High level ± 10 V, 0...10 V, ± 5 V, 0...5 V (0...20 mA with external shunt) or

1...5 V, 4...20 mA (4...20 mA with external shunt). The **TSX AEY 1614** module is an analog input module with 16 thermocouple inputs. Depending on the selections made during configuration, the following range is available for each of the input channels (supporting a common mode between them of  $\pm$  250 V or  $\sim$  280 V): thermocouples B, E, J, K, L, N, R, S, T, U, or electrical range + 80 mV

#### Functions

Scanning of input channels, gain selection according to input signals, multiplexing.
 Digitisation of input signals.

□ Converting input measurements to user format: recalibration coefficient,

linearisation, cold junction compensation, filtering, scaling.

□ Module monitoring: conversion circuit test, range overshoot test, terminal block presence test, sensor link test, "watchdog" test.

#### TSX<sup>™</sup> ASY 410, 800 analog output modules

The **TSX ASY 410** module has 4 analog outputs isolated from each other, and the **TSX ASY 800** module has 8 outputs with common point. Depending on the choice made during configuration, the modules offer the following range for each of its outputs:  $\pm$  10 V, 0...20 mA and 4...20 mA without external supply.

#### Functions

□ Protection of the module against overvoltages.

- □ Adaptation to the different actuators: voltage or current output.
- □ Conversion of digital signals to analog signals: 11 bits + sign for **TSX ASY 410** and 13 bits + sign for **TSX ASY 800**.

 $\hfill\square$  Transforming application data into data which can be used by the digital/analog converter.

□ Module monitoring and detected fault indication to the application: converter test, range overshoot test, terminal block presence test, "watchdog" test.

#### Setup

Unity<sup>™</sup> Pro or PL7<sup>™</sup> Junior/Pro software performs configuration and debugging functions:

□ Choice of modules used.

Configuration of channels according to the type of module: scanning (normal or fast), cold junction compensation (internal or external), range, filtering, display format, task (MAST or FAST), detection of terminal block presence, wiring check.
 Debugging, access to certain parameter settings, module/channel diagnostics, forcing, calibration.

Discrete I/O IP 67 modules on Fipio<sup>®</sup> bus

## Presentation

De-centralizing the I/O meets the requirements of both users and machine manufacturers while maintaining performance comparable with that of a centralized structure.

Fipio® bus dust and damp proof I/O modules are used to create distributed control systems by removing the need for enclosures, improving connections and thus increasing the availability of installations. These IP 67 protection modules also offer the possibility of locating the standard I/O interfaces used in the processes or machines in harsh environments (oil jets, water jets, dust etc).

Unity<sup>™</sup> Pro or PL7<sup>™</sup> Junior/Pro programming software is used for the software configuration and installation of the dust and damp proof I/O modules on the Fipio bus.

There are 4 types of Fipio bus dust and damp proof I/O module:

- Input module, 8 channels, == 24 V IEC type 2: TSX<sup>™</sup> EEF 08D2.
- Input module, 16 channels = 24 V IEC type 2: TSX EEF 16D2.

■ Mixed module, 8 IEC type 2 inputs/8 x 0.5 A transistor outputs, == 24 V: TSX<sup>™</sup> EMF 16DT2.

Output module, 8 channels, 2 A transistor outputs, = 24 V: TSX ESF 08T22.

Furthermore, this module design offers a number of special functions:

Remote power supply: the Fipio modules, inputs, and Fipio communication power supplies are provided using a single cable. Each remote power supply can be used to power up to 31 modules.

- A daisy-chained module can be changed without interrupting the bus.
- An operator terminal can be connected at any point on the bus.
- Short-circuits in the sensor power supply can occur without causing the bus to malfunction.
- A Fipio bus fast connection system using cables and M23 connectors.
- A sensor/preactuator fast connection system using an M12 connector.

The Fipio bus dust and damp proof I/O modules conform to the following standards and approvals:

- IEC/EN 61131.
- CNOMO.
- Fipio<sup>®</sup> certification.
- DIN.
- UL certification.
- CSA certification.
- C€ mark.

# Modicon<sup>®</sup> Premium<sup>™</sup> automation platform

Discrete I/O IP 67 modules on Fipio® bus

### Architecture (continued)

The Fipio® fieldbus is a standard relating to communication between different automation components where the IP 67 dust and damp proof I/O are located remotely.

Each segment supports up to 31 IP 67 I/O modules over a maximum distance of 1000 m. Because the IP 67 I/O modules have a remote power supply, the voltage drops caused by the connected modules limit the maximum distances between each T-junction box (from the one which provides the --- 24 V power supply) and the remote powered IP 67 I/O modules. For the calculation of these distances, see page Modicon<sup>®</sup> Premium<sup>™</sup> Cat Interior Rev 11-09/38.

The use of electrical or electrical/fiber-optic repeaters allows the connection of up to 98 IP 67 I/O modules on 5 segments over a maximum distance of 15,000 m.

### Description

#### TSX<sup>™</sup> EEF 08D2 and TSX EEF 16D2 modules

Dust and damp proof input modules are monobloc type in an IP 67 casing and include:

- 1 8 female M12 type fast connectors for connecting the sensors (2 input channels per connector for the 16-channel model).
- 2 8 or 16 channel status indicator lamps.
- **3** 3 status indicator lamps for module operation and integrated communication.
- 4 Dust and damp proof male M23 type connector for connection of the Fipio bus, the --- 24 V power supply for the sensor and the internal electronics of the module.
- 5 Access to the addressing micro-switch.
- 6 1 or 2 sensor power supply status indicators.
- 7 9 slots for channel and module referencing labels (10 labels supplied).

Two sealing plugs for M12 connectors are supplied with every module.

### TSX<sup>™</sup> ESF 08T22 module

Dust and damp proof output modules are monobloc type in an IP 67 casing and include:

- 1 8 female M12 type fast connectors for connecting the preactuators.
- 2 8 channel status indicator lamps.
- 3 3 status indicator lamps for module operation and integrated communication.
- 4 Dust and damp proof male M23 type connector for connection of the Fipio bus and the power supply for the internal electronics of the module.
- 5 Access to the addressing micro-switch.
- 6 2 preactuator power supply presence indicators.
- 7 A male 7/8" type connector for connecting the two --- 24 V preactuator power supplies.
- 8 9 slots for channel and module referencing labels (10 labels supplied).
- Two sealing plugs for M12 connectors are supplied with the module.

### TSX<sup>™</sup> EMF 16DT2 module

Dust and damp proof I/O modules are monobloc type in an IP 67 casing and include:

- 1 8 female M12 type fast connectors of which 4 are for connecting the sensors and 4 for the preactuators (2 input channels or 2 output channels per connector).
- 2 16 channel status indicator lamps
- **3** 3 status indicator lamps for module operation and integrated communication.
- 4 Dust and damp proof male M23 type connector for connection of the Fipio bus, the --- 24 V power supply for the sensor and the internal electronics of the module.
- 5 Access to the addressing micro-switch.
- 6 2 preactuator power supply presence indicators.
- 7 A male 7/8" type connector for connecting the two --- 24 V preactuator power supplies.
- 8 1 sensor power supply status indicator.
- 9 9 slots for channel and module referencing labels (10 labels supplied).

Two sealing plugs for M12 connectors are supplied with the module.

# Description (continued)

# Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Discrete I/O IP 67 modules on Fipio<sup>®</sup> bus

### **Description** (continued)

### TSX<sup>™</sup> EF ACC 2●●● Fipio<sup>®</sup> bus connecting cables

**TSX EF ACC 2000** cables are used to carry Fipio bus signals and the == 24 V power supply for the sensors and the internal electronics of TSX EEF/ESF/EMF modules.

### They are comprised of:

1 A trunk cable, with a 150 ☐ shielded twisted pair and a 1.5 mm<sup>2</sup> power supply pair, 0.2, 1, 3, 7, 12 or 25 m long depending on the model (radius of curvature 30 mm, Ø 9.5 mm).

### At one end:

2 An insulated IP 67 male connector, with M23 type ring, 6-way for Fipio connection to the preceding module n-1 (or to the upstream T-junction box).

At the other end: an insulated double connector comprising :

An IP 67 female connector, with M23 type ring, 6-way for connection to module n.
 An IP 67 female connector, with M23 type thread, 6-way for an outgoing cable of the same type for connection to the next module n+1 (or to the downstream T-junction box).

Use of this cable on the dust and damp proof I/O modules:

- Locks access to the module's Fipio addressing microswitch.
- Helps to ensure continuity of the Fipio bus even if the module is disconnected (when replacing a module, for example). Patented system.

### **TSX EF ACC 99 T-junction box**

The IP 65 T-junction box is comprised of:

- A male M23 type soldering connector for connecting the Fipio bus (incoming and outgoing).
- 2 A male 7/8" type connector for connecting the --- 24 V power supply for the remote powered modules, fitted with a protective plug.
- 3 A female M23 type connector for connecting the Fipio bus (outgoing), fitted with a sealing plug.
- 4 An access cover for the 9-way female SUB-D connector used for connecting an operator terminal.

# *Functions, characteristics*

# Modicon<sup>®</sup> Premium<sup>™</sup> automation platform

Discrete I/O IP 67 modules on Fipio® bus

## Functions

Remote dust and damp proof I/O modules can be integrated with the following monitoring devices:

#### Inputs:

□ power supply status monitoring in groups of 8 channels. Indicated on the front panel by the SF1 and SF2 indicator lamps (red).

□ module status monitoring. Indicated on the front panel by the ERR indicator lamp (red).

One status bit for the module is available at PLC processor level for use by the user program.

### Outputs:

□ pre-actuator power supply presence monitoring in groups of 4 channels. Indicated on the front panel by the US1 and US2 indicator lamps (green). A power supply presence bit is associated with each indicator lamp.

□ short-circuit monitoring for each channel. Indicated on the front panel by an indicator lamp for each channel (red). There is one status bit per channel (for 8 channel modules) or per group of 2 channels (for mixed modules). In addition, there is one bit per group of 4 channels which can be used to reset the channels remotely.

□ module status monitoring. Indicated on the front panel by the ERR indicator lamp (red). One status bit for the module is also available.

In the case of the **TSX<sup>™</sup> EMF 16DT2** mixed module, a diagnostic bit allows the origin of the power supply status to be determined (input or output power supply).

Dust and damp proof input/output wiring system

#### A: Main junction box B: Remote powered T-junction box

3/38

## Control of == 24 V voltage drop

The dust and damp proof I/O module power supply is carried by Fipio<sup>®</sup> cables, which means that the maximum distance from each **TSX**<sup>™</sup> **EF ACC 99** T-junction box depends on the type of == 24 V power supply and the number of I/O modules. The power supply voltage of the last module must be no lower than 19.2 V. Typical voltage drops are given in the table below (1):

Number of input/output modules		Distance between T-junction box (used with 24 V remote supply) and last input/output module										
	m	10	20	30	50	75	100	125	150	200	250	300
5	V	0.09	0.18	0.28	0.46	0.7	0.9	1.2	1.4	1.9	2.3	2.8
10	V	0.17	0.34	0.51	0.86	1.3	1.7	2.1	2.6	3.4	4.3	5.1
15	V	0.25	0.5	0.75	1.25	1.9	2.5	3.1	3.7	5	6.2	7.5
20	V	0.32	0.65	0.98	1.63	2.5	3.3	4	4.9	6.5	8.2	9.8
25	V	0.4	0.8	1.2	2	3	4	5	6	8.1	10	12
30	V	0.48	0.96	1.45	2.4	3.6	4.8	6	7.2	9.6	12	14.5

(1) The typical values are given for connecting 2-wire sensors. If using 3-wire sensors, apply a coefficient of 1.77 to these voltage drop values.

Example: Use of a 24 V  $\pm$  3% power supply

Over a distance of 100 m and connecting 30 dust and damp proof I/O modules. The voltage drop is  $(24 \times 0.97) - 4.8 = 18.48$  V (which is less than the permitted 19.2 V). It is necessary to insert a second == 24 V power supply via a TSX<sup>™</sup> EF ACC 99 T-junction box (distance to be defined and verified according to the installation topology).

# Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Discrete I/O IP 67 modules on Fipio<sup>®</sup> bus

**T-junction box** 

1 TSX<sup>™</sup> EF ACC 99: IP 65 Fipio bus T-junction box, used to connect the --- 24 V power supply intended for dust and damp proof I/O. It also has a 9-way female SUB-D connector for an operator terminal. This box also serves as the main Fipio bus junction box A as well as for connecting the --- 24 V T-junction power supply (example B).

### Connectors

- 2 TSX EF CF 01: IP 67 female soldering connector with M23 type ring, 6-way for connection of Fipio bus and --- 24 V power supply. This type of connector is used at the ends of **TSX FP CA/CC/CP/CR ●00** cables.
- 3 TSX EF CM 01: IP 67 male soldering connector with M23 type ring, 6-way for connection of Fipio bus and ... 24 V power supply. This type of connector is used at the ends of **TSX FP CA/CC/CP/CR ●00** cables.
- 4 TSX EF CF 03: IP 67 female 7/8" type screw connector, 5-way for --- 24 V power supply connection. This type of connector is used for the --- 24 V power supply of the TSX ESF/EMF I/O modules and the TSX EF ACC 99 T-junction box. The maximum current permitted for each connector contact is 8 A.
- 5 TSX EF CM 03: IP 67 male 7/8" type screw connector, 5-way for connection to a TSX EF CT 03 T-connector used for the --- 24 V preactuator power supply.
- 6 TSX EF CT 03: IP 67 7/8" type T-connector, 5-way for daisy-chaining the --- 24 V pre-actuator power supply. The maximum current permitted for each connector contact is 8 A.
- 7 TSX EF CF 02: IP 67 female soldering connector with M23 type thread, 6-way for extending Fipio TSX FP CP ●00 cables.
- 8 TSX<sup>™</sup> FP ACC 2 or TSX FP ACC 12: 9-way SUB-D connectors for Fipio/Fipway connection to PLC. Used for daisy chain or tap link connection (90° output high or low, 45° output high or low).

### Cables

- 9 TSX EF ACC 2000: trunk cable, a 150 shielded twisted pair and a 1.5 mm<sup>2</sup> power supply pair. Fitted with an M23 male connector and a double M23 female/female connector.
- 10 TSX FP CP ●00: trunk cable, a 150 ] shielded twisted pair and a 1.5 mm<sup>2</sup> power supply pair (Ø 9.5 mm). Wire ends free to fit IP 67 M23 type soldering connectors TSX EF CF 01/02 and TSX EM CM 01.
- 11 TSX FP CC ●00: tap link cable, double shielded twisted pair 150 [ (Ø 8 mm) for normal environments and use inside buildings. Wire ends free to fit IP 67 M23 type soldering connector TSX EF CM 01.
- 12 TSX FP CA ●00: trunk cable, shielded twisted pair 150 [] (Ø 8 mm) for normal environments and use inside buildings.

TSX FP CR  $\bullet$ 00: trunk cable, shielded twisted pair 150 [] (Ø 8 mm) for harsh environments and use outside buildings.

Wire ends free to fit IP 67 M23 type soldering connectors **TSX EF CF 01/02** and **TSX EF CM 01**.

### Other components

- 13 TSX EF ACC 7: IP 67 M23 type line terminator, to be placed at one or both ends of the segment, depending on the use.
- 14 TSX FP ACC 7: IP 20 line terminator (set of 2), to be placed at one or both ends of the segment, depending on the use.
- 15 TSX FP CG 0•0: tap link connecting cable for TSX FPP 10 PCMCIA card for TSX Micro/Premium PLC and PC compatibles.

### Calculation of bus length

The total length of a bus is the sum of the lengths of the trunk cables plus the lengths (multiplied by 2) of the tap link cables.

i.e. in the example opposite, the length of the cables is:  $\Sigma 12 + \Sigma 9 + \Sigma 10 + (2 \times \Sigma 11)$ .

Motor starter with GV2 ME circuit-breakers

Motor starter with GV3 P circuit-breakers

TeSys® Quickfit is a modular system which standardizes and simplifies the set up of motor starters by utilizing its pre-wired control and power circuits.

- Installation of a motor starter is guick, simple and flexible. In addition, this system:
- enables the motor starter to be customized at a later date,
- reduces maintenance time and

• optimizes panel space by reducing the number of terminals and intermediate interfaces and the amount of ducting.

## System for motor starters with spring terminals

- Motor starters with TeSys® GV2 ME circuit-breakers
- From 0 to 18 A max.,
- TeSys GV2 ME circuit-breakers combined with LC1 D contactors from 9 to 25 A (spring terminal version),
- Quickfit pre-wired power and control connections.

### Motor starters with TeSys® GV3 P circuit-breakers

- From 9 to 65 A max.,
- TeSys GV3 P circuit-breakers combined with LC1 D contactors from 40 to 65 A (spring terminal version),
- Quickfit pre-wired control connections only,
- For pre-wired power connections, use busbar sets from the TeSys d 40 to 65 A contactor range (see page 24511/9).

This range is comprised of pre-wiring components for:

- the power circuits,
- the control circuits.

### Power circuit pre-wiring components (motor starters with TeSys GV2 circuit-breakers only)

**a power circuit connection kit** comprising, for each starter, a plate for mounting the contactor and the circuit-breaker and two power connection modules,

- a power splitter box for 2 or 4 starters,
- an upstream terminal block for a power supply up to 60 A (16 mm<sup>2</sup>),

■ an outgoing terminal block for connection of the motor power supply cables and the ground cables (6 mm<sup>2</sup>).

**Note:** with GV3 circuit-breakers, no accessories are required for pre-wiring of the power circuit. The GV3 P•• outgoing terminal block can be removed. This circuit-breaker is also sold with only one terminal block (reference: GV3 P••1).

#### Control circuit pre-wiring components (motor starters with TeSys GV2 and GV3 circuit-breakers)

■ a control circuit connection module which plugs directly into the contactor and the circuit-breaker on each starter. This module incorporates status and control data for this motor starter.

■ a parallel wiring module which concentrates the data of each motor starter: □ HE 10 connector, for centralized applications. Data is transmitted to the PLC via the Advantys Telefast pre-wired system.

□ **STB**, designed for decentralized automation architectures. This module is suitable for use in an Advantys STB configuration for connection to the PLC via a field bus.

# Modicon<sup>®</sup> Premium<sup>™</sup> automation platform

Use of Preventa<sup>™</sup> machine safety modules

## Machine safety

Production workshops and technical building installations are subject to increasing requirements for machine safety.

A good machine design combines the following

- Protection of personnel.
- Availability of the production tool.
- Good machine design is achieved by:
- □ optimizing personnel protection and machine availability,
- □ using basic principles: redundancy, self-monitoring, etc,
- □ considering reliability (determine correct machine behavior in the event of communication loss or other
- unplanned events),
- ease of maintenance.

# The machinery directive and the work equipment directive

### The machinery directive

A machine manufacturer is required to conform to the machinery directive

The machinery directive (89/392/EEC, 91/36/EEC, 93/44/EEC and 93/68/EEC) is designed to help ensure the free circulation of machinery and safety components in European Union countries and to improve the level of protection for personnel.

Harmonized European standards establish technical specifications which comply with the minimum safety requirements defined in the corresponding directive.

Manufacturers must produce machinery which conforms to safety requirements.

### The work equipment directive

The user is required to ensure that his range of machines conforms to the use of work equipment by workers at work directive

Directive 89/655/EEC lays down the minimum objectives for protection in the working environment and in particular concerns the use of products. The directive specifies the general framework of preventative measures which should be taken in the workplace.

### Machine safety and automated systems

Hazardous areas must be identified and have restricted access, and be controlled in a secure manner. It should be noted that the use of safety products does not necessarily mean that the machine conforms to the machinery directive.

It is the operation, wiring, compatibility and scheme used, that enable the machine to meet the required standards. It is more important to think in terms of safety solutions rather than safety products.

### Schneider Electric - a machine safety specialist

Schneider Electric, a specialist in machine safety applications and products, has a range of several thousand products, some of which are designed specifically to address machine safety requirements.

For further details on components for safety applications, please consult our catalog: "Preventa<sup>™</sup> Machine Safety Products 2009".

# Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Use of Preventa<sup>™</sup> machine safety modules

immediate placement of the equipment into a non-hazardous position.

# Non-controlled safety systems The control signal from the protection device (emergency stop pushbutton illustrated to the left) acts directly on the power contactor of the machine. In this type of scheme, the risks of simple detected faults are: Emergency Emergency stop button being shorted. ■ KM1 contactor sticking. When the operator presses an emergency stop button, the instruction is not processed, and another sequence can begin following the emergency stop, despite the presence of the detected fault. In the case of detected failure, the safety function (1) is compromised. Therefore, a reliable intermediate relay system must be used. 66.84 KM KM3 F (1) A safety function is a function whose non-execution or untimely execution results in the

Safety system controlled by a Preventa<sup>™</sup> safety module

Preventa safety modules provide a reliable interposing relay function by helping to eliminate the risks of:

KM5

KMB

- An inoperative control circuit (inputs).
- An inoperative power circuit (outputs).
   An inoperative internal component on a safety module.

# Modicon<sup>®</sup> Premium<sup>™</sup> automation platform

Preventa<sup>™</sup> machine safety modules type TSX<sup>™</sup> PAY

# Presentation

- TSX<sup>™</sup> PAY safety modules integrated in the Modicon<sup>®</sup> Premium<sup>™</sup> PLC combine :
- □ the simplicity of use of Preventa<sup>™</sup> machine safety modules
- □ the high performance of PLC diagnostics

in addition to the advantages of a standard PLC (extended choice of I/O, simplicity of setup, flexibility for hardware and software developments, etc).

TSX PAY safety modules incorporate in a single module, a Preventa (XPS) hard-wired safety block and an electronic data acquisition unit for complete diagnostics of input contacts and the state of outputs in the safety system.

TSX PAY safety modules are used to interrupt one or more Emergency stop or safety stop control circuits according to the standards IEC/EN 60204-1 and EN/ISO 13850.

The proven performance of hard-wired technology and the performance of Premium<sup>™</sup> PLCs make the TSX PAY modules the optimum solution for creating machines which are more available, more compact and lower in cost.

# Solution for applications requiring safety systems and high-performance diagnostics

The solution, integrated safety modules, enables complete diagnostics on the entire safety system. This diagnostics quickly locates the inoperative contact, pushbutton cables, or limit switch, without additional contacts on the inputs and without any additional wiring.

TSX PAY safety modules have their own power supplies and operate independently of the PLC processor.

TSX PAY modules are suitable for Emergency stop and limit switch monitoring applications, demanding up to a category 4 rating according to standard EN 954-1/ ISO 13849-1 (parts of control systems relating to safety).

## **Functions**

TSX PAY modules offer the following functions:

■ Monitoring of 1 to 12 double or single pushbutton contacts, Emergency stop and limit switches for safety guards for an Emergency stop or immediate stop safety system (Emergency stop category 0 according to standard EN/ISO 13850).

- Hard-wired safety block identical to Preventa XPS safety modules:
- □ 2 or 4 N/O (normally open) safety outputs,
- □ 12 double contact inputs.
- Safety block independent of the Premium PLC processor: the PLC does not operate on the safety module.
- 28 LEDs on the module display block: for complete diagnostics of the safety system
- system.
- Electronic data acquisition units for complete diagnostics of the safety system:

□ read the status of the 24 inputs (image of the status of the 12 pushbuttons or limit switches)

- read the enable input,
- □ read the feedback loop,
- □ read the safety outputs control,
- □ monitor the external power supply of the module.

This electronic data acquisition is designed so that the safety function is not compromised by detected failure. If the safety system uses more sensors, it is possible to connect several TSX PAY modules.

type TSX<sup>™</sup> PAY

# TSX<sup>™</sup> PAY 262 module schematic

To help ensure the safety function regardless of the first detected failure, it is compulsory to use:

- For the inputs: Emergency stop pushbuttons or safety limit switches with double contacts
- For the outputs: if relaying is necessary, use a guided contact relay
- On the module power supply : an F1 protection fuse (see characteristics page 4/7)

Schneider Gelectric

# Description, connection principle

# Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Preventa<sup>™</sup> machine safety modules

type TSX<sup>™</sup> PAY

# Description

- TSX<sup>™</sup> PAY safety modules feature the following on the front panel :
- 1 Rigid IP 20 casing to hold and protect the electronic card.
- 2 Display block (32 LEDs) showing operating modes, and the status of the safety system.
- 3 High density 44-way SUB-D connector for connecting the safety system.
- 6-way removable screw terminal block for connecting the safety outputs. 4
- 5 Marking for labeling the safety outputs.
- 6 Marking for the external power supply of the module.

### **Connection principle**

Two types of connection for TSX PAY safety modules are available:

### Standard wiring

A TSX<sup>™</sup> CPP 301 3 m cordset is fitted with a 44-way SUB-D moulded, elbow connector at one end, and flying leads differentiated by a color code at the other end.

This wiring system conforms to the standard EN 954-1/ISO 13849-1.

#### Fast wiring

Using the Advantys<sup>™</sup> Telefast<sup>®</sup> ABE 7 pre-wired system facilitates the installation of TSX PAY safety modules by giving access to inputs on the safety system via screw terminals.

Connection is carried out using TSX CPP •02 cordsets fitted with 44-way SUB-D moulded, elbow connectors at both ends.

The Advantys Telefast ABE 7CPA13 sub-base enables the connection of 12 double or single contact inputs, the power supply, reset inputs and the feedback loop.

This wiring system conforms to the standard EN 954-1/ISO 13849-1.

# Connections

# Modicon<sup>®</sup> Premium<sup>™</sup>

automation platform Preventa<sup>™</sup> machine safety modules type TSX<sup>™</sup> PAY

Single contact wiring is not suitable for applications which require a category 3 or 4 safety level. A short-circuit on a contact is not detected.

When using less than 12 single contacts, connect the input terminals which are not being used.

For applications with more than 12 single contacts, it is possible to use several TSX PAY modules by wiring the outputs in series.

Double contact wiring of the inputs is necessary for creating applications which require a category 3 or 4 safety level. When prompted, the first faults are detected and located. A short-circuit between the 2 inputs is detected. When using less than 12 double contacts, connect the input

terminals which are not being used. For applications with more than 12 double contacts, it is possible

to use several TSX PAY modules by wiring the outputs in series.

## Safety output connection schemes

The design of a category 3 or 4 immediate stop system requires redundancy and checking, on request, of the power supply breaker devices.

The wiring of N/C contacts (K3 and K4) enables this check on each request. Relays K3 and K4 must be mechanically linked contact relays.

When TSX PAY modules cut the power directly, it is necessary to connect the terminals Y1 and Y2/S33.

Preventa<sup>™</sup> configurable safety controllers type XPS MC

## Presentation

Configurable safety controllers XPS MC••Z• are designed to provide a solution for safety applications requiring conformity to category 4 of standard EN 954-1/EN/ ISO 13849-1 and SIL 3 requirements of standard IEC 61508.

This range of configurable controllers is comprised of 6 products, each with different technical characteristics.

Configurable	Inputs	Outputs (1)	Communication via			
controllers			CANopen bus	Profibus <sup>™</sup> bus	Modbus® serial link	
XPS MC16Z	16	6 + 2 x 2	-	-	Yes, slave	
XPS MC16ZC	16	6 + 2 x 2	Yes, slave	_	Yes, slave	
XPS MC16ZP	16	6 + 2 x 2	-	Yes, slave	Yes, slave	
XPS MC32Z	32	6 + 2 x 2	-	-	Yes, slave	
XPS MC32ZC	32	6+2x2	Yes, slave	-	Yes, slave	
XPS MC32ZP	32	6 + 2 x 2	-	Yes, slave	Yes, slave	

### Line control

The safety inputs are supplied by the various control outputs (2), in such a manner so as to monitor for short-circuits between the inputs, short-circuits between each input and ground, or the presence of residual voltages.

The controller, assisted by the control outputs, continuously tests the connected inputs. As soon as an error is detected on an input, the outputs associated with this input are disconnected. Safety outputs associated with other inputs remain active.

### Configuration

Safety controllers XPS MC••Z• are configurable and addressable using software XPS MCWIN running on a PC. Connection accessories required: see page 4/17 of this catalog.

### Connections

For connection of safety inputs and outputs, safety controllers XPS MC••Z• can be fitted with a choice of:

□ screw connectors type XPS MCTS●●, or

□ spring clip connectors type XPS MCTC●●

These connectors are to be ordered separately, see page 4/17 of this catalog.

(1) 8 independent safety outputs = 6 solid-state safety outputs + 2 x 2 relay outputs (4 relay outputs with guided contacts).

(2) 8 control outputs are available but they are not safety outputs.

Preventa<sup>™</sup> configurable safety controllers type XPS MC

## Safety functions

Configuration of the safety functions is carried out using software XPSMCWIN which is available on the Safety Suite V2 CD-ROM.

30 certified functions are available with this software and they are easily assignable to the safety outputs. These safety functions have multiple combination possibilities and various starting conditions.

The functions are:

□ certified in accordance with EN 954-1/EN/ISO 13849-1 and IEC 61508, □ configurable in controller XPS MC using software XPSMCWIN which is available on the Safety Suite V2 software pack.

The 8 safety outputs are suitable for use in related parts of control systems conforming to category 4 of EN 954-1/EN/ISO 13849-1 and each output can disconnect one of its safety circuits.

### Main safety functions

- Emergency stop monitoring, with or without time delay, 1 or 2-channel wiring
- Two-hand control (type III-C conforming to EN 574/ISO 13851)
- Guard monitoring with 1 or 2 limit switches
- Guard monitoring for injection presses and blowing machines
- Magnetic switch monitoring
- Sensing mat monitoring
- Light curtain (type 4 conforming to EN/IEC 61496, relay or solid-state output) monitoring
- Zero speed detection
- Dynamic monitoring of hydraulic valves on linear presses
- Monitoring safety stop at top dead center on eccentric press
- Safety time delays
- "Muting" function of light curtains
- Enabling switch monitoring, 2 or 3 contact
- Hydraulic press
- Eccentric press
- Foot switch monitoring
- Chain shaft breakage monitoring
- Position selector

# **Description**

### Configurable safety controllers XPS MC •• Z • Front face of controllers:

- 1 LED display and system diagnostics.
- 2 Two LEDs for CANopen or Profibus<sup>™</sup> (1) connection status.
- 3 SUB-D 9-pin male connector for connection on CANopen bus (XPS MC16ZC/ MC32ZC)
  - or SUB-D 9-pin female connector for connection on Profibus bus (XPS MC16ZP/ MC32ZP).
- Solid-state safety output and "muting" indicator light terminals. 4
- 5 Power supply (---- 24 V) and relay safety output terminals.
- 6 Control output terminals for power supply to safety inputs and safety input terminals.
- RJ45 connector for connection on Modbus serial link. 7
- 8 RESET button (resetting of controller).

Rear face of controllers:

9 Fixing plate for mounting on rail.

(1) Depending on controller model.

LED details					
LED	Color	Status	Meaning		
1 PWR	Green	On	Supply voltage present.		
2 CNF	Yellow	On	In configuration mode.		
		Flashing	Not configured, initial power-up.		
3 Eln	Red	On	Internal detected error: safety outputs deactivated.		
4 EEx	Red	On	External detected error: safety outputs associated with the circuit are deactivated.		
5 COM	Green	On	Controller communicating via the TER (RJ45 connection.		
6 R1, R2	Green	On	Relay outputs 13/14, 23/24, 33/34 and 43/44 activated.		
		Flashing	Detected fault on these outputs.		
7 RUN Green	Green	Off	Hardware OK for the Profibus bus or the CANopen bus.		
		On	Communicating on Profibus bus or on CANopen bus. Normal status.		
8 ERR	Red	On	Communication impossible, incorrect configuration, damaged cabling or absence. Bus deactivated		
		Off	Communicating on CANopen or Profibus bus Normal status.		
		Flashing (x 1)	Warning limit reach.		
		Flashing (x 2)	Detected control event error on CANopen bus		
		Flashing (x 3)	Synchronization error on CANopen bus.		
9 116	Green	On	Input circuit closed.		
132		Flashing	Error detected on input relating to LED.		
<mark>10</mark> 0106	Green	On	Solid-state output activated.		
		Flashing	Short-circuit, detected fault on output.		
11 RUN	Green	On	Run mode.		
		Flashing	Changing from run mode to stop mode.

#### **Configuration software**

■ Reference XPS MCWIN is the full version of configuration software XPSMCWIN version 2.10 and must be installed if no previous version of this software has been installed.

■ Reference SSVXPSMCWINUP is an update for software XPSMCWIN and can be used if SSVXPSMCWINUP has been installed using Safety Suite V1. An update from version 2.0 to version 2.10 for the software XPSMCWIN will then be performed.

## Presentation. description, operation

### Modicon<sup>®</sup> Premium<sup>™</sup> automation platform TSX<sup>™</sup> CTY 2A/4A counter modules

### **Presentation**

Counting functions are required for counting parts or events, grouping objects, incoming or outgoing flow control, and measuring the length or the position of elements.

Modicon<sup>®</sup> Premium<sup>™</sup> PLCs perform these functions using TSX<sup>™</sup> CTY 2A/4A counter modules which have a counting frequency of 40 kHz maximum. In a Premium PLC configuration, the number of TSX CTY counter modules is added to the number of other application-specific modules (communication, motion control and weighing). See pages 1/12, 1/21 and 1/31. They can be disconnected while powered up. Counter modules are characterized by the number of channels:

■ 2 channels with downcounting, upcounting and up/down counting functions for the TSX CTY 2A module,

■ 4 channels with downcounting, upcounting and up/down counting functions for the TSX CTY 4A module.

The parameters of these functions are set by software configuration. The modules accept = 5 V or = 10 to 30 V solid state output sensors (incremental encoders, proximity sensors, photoelectric detectors) and mechanical contact output sensors (in this case the counting frequency is limited to 100 Hz).

### Description

The front panel of TSX CTY 2A (2-channel) and TSX CTY 4A (4-channel) counter modules is comprised of:

- One 15-way SUB-D type connector per channel for connecting: 1
- □ Counting sensors or incremental encoder.
- □ Sensor power supply.
- □ Encoder supply feedback for checking it is correctly supplied.
- 2 One 20-way HE10 type connector for 2 channels for connecting on each channel:
- □ Auxiliary inputs: preset, enable.
- □ Reflex outputs.
- Dever supplies for auxiliary I/O and incremental encoders.
- 3 Rigid casing which:
- □ Holds the electronic card.
- Locates and locks the module in its slot...
- Module diagnostic LEDs: 4
- □ Module diagnostics:
- Green RUN LED: module operating,
- Red ERR LED: detected internal fault, detected module failure,
   Red I/O LED: detected external fault.
- Channel diagnostics:
- Green CH LED: channel diagnostics available

#### **Operation block diagram** Block diagram of a channel

Counter modules are set up using PL7<sup>™</sup> Junior/Pro software

## Presentation, description, operation

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform

TSX<sup>™</sup> CTY 2C measurement and counter module

### Presentation

The **TSX<sup>™</sup> CTY 2C** measurement and counter module is used with fast machines requiring precise measurements with short cycle times and high input frequencies (timber machines, packing machines, etc).

The **TSX CTY 2C** measurement and counter module provides the standard functions (speed monitoring, reflex outputs, etc) enabling a simple position control function to be performed by the application program.

The **TSX CTY 2C** measurement and counter module also enables special functions to be managed.

#### Description

The front panel of a TSX CTY 2C measurement and counter module is comprised of:

- 1 One 15-way SUB-D connector per channel for connecting:
- □ Counting sensors or incremental encoder,
- SSI absolute encoder or parallel output encoder with ABE 7CPA11 sub-base,
- □ Sensor power supply,
- □ Encoder power supply feedback for checking it is correctly supplied.
- 2 One 20-way HE10 connector for connecting on each channel :
- □ Auxiliary inputs: preset, enable and read,
- □ Reflex outputs,
- □ Programmable frequency output,
- Dever supplies for auxiliary I/O and encoders.
- 3 Rigid casing which:
- □ Holds the electronic card,
- □ Locates and locks the module in its slot...
- 4 Module diagnostic lamps:
- □ Module diagnostic:
  - Green RUN: module operating.
  - Red ERR lamp: detected internal fault, detected module failure.
  - Red I/O lamp: detected external fault.
- □ Channel diagnostic:
  - Green CH• lamp: channel diagnostics available.

### **Operation block diagram**

#### Block diagram of a channel

Counter modules are set up using Unity<sup>™</sup> Pro or PL7<sup>™</sup> Junior/Pro software

(1) The enable input and output 2 cannot be used simultaneously.

## **Characteristics**

# Modicon<sup>®</sup> Premium<sup>™</sup> automation platform TSX<sup>™</sup> CTY 2C measurement and

counter module

Electrical characteristics					
Type of module		TSX™ CTY 2C			
Modularity		2 channels			
Frequency on counter inputs		Counting: 1 MHz. With phase-shifted signal encoder: multiplication by 1: 500 kHz, multiplication by 4: 250 kHz			
Consumption	mA	see page 9/6			
Dissipated power	w	7 typical (10 max.)			
Sensor power supply check		Yes			
Module cycle time	ms	1 (for 2 channels)			
Event processing response time	ms	Acceptance of event-triggered input (enable/read/preset) and positioning of - a reflex output: 1 ms - discrete output modules <b>TSX DSY 8T22</b> : 2.1 ms ; <b>TSX DSY 32T2K:</b> 3.2 ms.			

### Input characteristic

Type of input				Counter inputs		Auxiliary inputs
.,,,,,,,,				IA/IB/IZ or SSI absolute encoder	IA/IB/IZ	(preset, enable, read)
Nominal values		Voltage	v	5	24	24
		Current	mA	18	16	8
Limit values		Voltage	v	≤ 5.5	1930 (up to 34 V possible, limited to 1 hr per 24 hr period)	1930 (up to 34 V possible, limited to 1 hr per 24 hr period)
	At state 1	Voltage	v	≥ 2.4	≥ 11	≥ 11
		Current	mA	> 3.6 (for U = 2.4 V)	> 6 (for U = 11 V)	> 6 (for U = 11 V)
	At state 0	Voltage	v	≤1.2	≤5	≤5
		Current	mA	< 1 (for U = 1.2 V)	< 2 (for U = 5 V)	< 2 (for U = 5 V)
Logic				Positive	Positive	Positive
Sensor voltage	check response	At loss of 24 V	ms	-	-	< 2.5
time		At return of 24 V	ms	-	-	< 10
Input impedanc	e	For nominal U	w	400	1500	3400
Input impedanc	e for U = 2.4 V (F	RS 422 compatibility)	w	> 270	-	-
Response time			ms	-	-	< 50
Type of input				Resistive	Resistive	Current sink
IEC/EN 61131 co	onformity			-	Туре 2	Туре 2
Proximity sense	or compatibility			-	2-wire/3-wire	2-wire/3-wire

<b>Output cha</b>	aracteristics				
Type of output			Auxiliary outputs (2 per channel)		
Nominal values	Nominal values Voltage		<u></u> 24		
	Current mA		500		
Voltage limits		V	1930 (up to 34 V possible, limited to 1 hr per 24 hr period)		
Maximum volta	ge drop at state 1	V	< 0.5		
Leakage curren	t	mA	< 0.1		
Switching time		ms	< 250		
Electrostatic dis	scharge time	s	L/R		
Switching frequ	ency on inductive load	Hz	F < 0.6 / (Ll <sup>2</sup> )		
Compatibility	With Premium d.c. inputs		Any positive logic inputs with input resistance < 15 kW		
	IEC/EN 61131-2		Yes		
Protection	Overloads and short-circuits		Current limiter and thermal tripping (reactivation via program or automatically)		
against	Channel overvoltages		Zener diode between outputs and + 24 V		
	Polarity inversions		Diode reverse-mounted on supply

# Description, operation

### Modicon<sup>®</sup> Premium<sup>™</sup> automation platform TSX<sup>™</sup> CCY 1128 electronic cam module

And the second s

The **TSX<sup>™</sup> CCY 1128** module performs the "electronic cam" function for an animated axis of a rotary movement in a single direction, alternating, cyclical (with periodic arrival of parts for processing) or endless (with random arrival of parts for processing). The axis is managed by an incremental or absolute encoder.

The **TSX CCY 1128** electronic cam module independently manages up to 128 cams on up to 32 tracks with as many as 24 discrete physical outputs and 8 logic outputs. Processing is structured in 4 groups of 8 tracks each, with groups 0 and 1 associated with the module connector 0 and groups 2 and 3 with connector 1.

The **TSX CCY 1128** module can be used for the following functions: elimination of axis backlash, position recalibration, capturing measurements (part length, number of points per revolution, angle of arrival of parts, slip, etc), anticipation of switching, parts counter, generating events.

Like other application-specific modules, the **TSX CCY 1128** module can be installed in any slot of a Premium PLC, except those dedicated to the power supply and the processor.

TSX CCY 1128

### Description

The front panel of the TSX CCY 1128 electronic cam module is comprised of:

- 1 One 15-way SUB-D connector for connecting the incremental or absolute encoder.
- 2 One 20-way HE 10 connector for connecting the track outputs on groups 0 and 1 (connector 0).
- 3 One 20-way HE 10 connector for connecting the track outputs on groups 2 and 3 (connector 1).
- 4 One 20-way HE 10 connector for connecting the auxiliary inputs and the encoder power supply.
- 5 Rigid casing for the following functions:
- Holding the electronic cards,
- □ Attaching and locking the module in its slot.
- 6 Module diagnostic indicator lights:
- □ Module diagnostics:
- green RUN indicator lamp: module on,
- red ERR indicator lamp, detected internal fault, module defective,
- red I/O indicator lamp, detected external or application fault.
- Channel diagnostics:
  - green CH0 indicator lamps, channel diagnostics operative.

The electronic cam module is set up using Unity<sup>™</sup> Pro or PL7<sup>™</sup> Junior/Pro.

TSX<sup>™</sup> CFY 11/21 modules for

stepper motors

### **Presentation**

The TSX™ CFY 11/21 stepper motor axis control range is intended for machines which simultaneously require motion control by stepper motor associated with sequential control by programmable controller.

The TSX CFY 11 module controls, via an amplifier for stepper motor, 1 axis (channel 0). The TSX CFY 21 module controls 2 axes (channels 0 and 1). They accept amplifiers with:

- RS 422 or TTL 5 V inputs (negative logic).
- RS 422 or == 5 V NPN open collector outputs.

In a Modicon<sup>®</sup> Premium<sup>™</sup> PLC configuration, the number of TSX CFY motion control modules should be added to the other application-specific modules (communication, counting, axis control and weighing).

#### Description

The front panel of TSX CFY 11/21 stepper control modules is comprised of:

- One 15-way SUB-D connector per channel for connecting:
- □ Amplifier inputs.
- □ Amplifier outputs.
- □ Amplifier input power supply.
- 2 One 20-way HE 10 connector for connecting:
- □ Auxiliary inputs: per axis, homing cam, emergency stop, limit switches (+ and -), event, external stop.
- □ Brake outputs (1 per axis).
- □ External power supplies for sensors and preactuators.
- Rigid casing which: 3
- □ Holds the electronic card.
- □ Locates and locks the module in its slot.
- 4 Module diagnostics lamps:
- □ Module diagnostics:
  - green RUN lamp: module operating,
  - red ERR lamp: detected internal fault, detected module failure,
  - red I/O lamp: detected external fault.
- □ Axis diagnostics:
  - 2 green CHe lamps: axis diagnostics available.

### **Operation block diagram**

Operating characteristics are described on page 4/36

Stepper control modules are set up using Unity<sup>™</sup> Pro or PL7<sup>™</sup> Junior/Pro software.

TSX<sup>™</sup> CAY motion control modules for servo motors

### Presentation

The servo-controlled TSX<sup>™</sup> CAY ●● positioning axis control offer is designed for machines requiring both high performance servo motion control in conjunction with PLC sequential control.

Depending on the model, the TSX CAY •• modules make it possible to:

On the front panel of the TSX CAY •• axis control modules there is:

4 HE 10 to 20-way connector for two axes (0/1 or 2/3) for connecting: □ auxiliary inputs: homing cam, emergency stop, event, recalibration,

- Control 2 independent axes, TSX CAY 21/22
- Control up to 4 independent axes, TSX CAY 41/42
- Control 3 linearly interpolated axes, TSX CAY 33

They accept servo drives with ±10 V analog inputs including Lexium 05, Lexium 15 and Lexium 17D servo drives.

TSX CAY •• modules can be inserted, like other application-specific modules, in any Modicon<sup>®</sup> Premium<sup>™</sup> PLC slots.

1 15-way SUB-D connector per axis for connection of an incremental or absolute

2 9-way SUB-D connector for connecting an analog output "speed reference" for

Description

- □ attaching and locking the module in its slot 6 LEDs for module diagnostics: □ at the module level: - Green RUN LED: module in operation
  - Red ERR LED: detected internal fault, module out of service
  - red I/O LED: detected external fault
  - □ at the axis level:

encoder

each axis

and reflex outputs

supporting electronic cards

- Green CHe LED: axis diagnostics present

3 HE 10 to 20-way connector axis for connecting:

□ external power supply of servo drive inputs/outputs

□ external sensor and preactuator power supplies

5 Rigid casing that performs the functions of:

auxiliary servo drive control inputs

TSX CAY 41/42

### Operation

### **Diagram of an axis**

Axis control modules are set up using Unity<sup>™</sup> Pro or PL7<sup>™</sup> Junior/Pro software.

Premium TSX<sup>™</sup> P57 ●●3M/4M slot PLCs are required for TSX<sup>™</sup> CAY 22/42/33 modules.

Presentation

### Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Lexium<sup>®</sup> 15 SERCOS<sup>™</sup> TSX<sup>™</sup> CSY 84/85/164

motion control modules

SERCOS<sup>™</sup> (SERial COmmunication System) is a communication standard which defines the digital link (exchange protocol and medium) between a motion control module and servo drives. This is defined in European standard IEC/EN 61491. The use of SERCOS distributed architecture allows application I/O (position encoder, emergency stop, etc.) to be connected directly to the servo drives, thus reducing connection costs. The fiber-optic digital link permits high speed exchanges (2 or 4 Mbps) while helping to ensure a high level of immunity in disturbed industrial environments.

The SERCOS range in the Modicon<sup>®</sup> Premium<sup>™</sup> automation platform consists of: ■ TSX<sup>™</sup> CSY 84/85/164 axis control modules *(1)* which can each control up to 8 servo drives (TSX CSY 84/85) and 16 servo drives (the TSX CSY 164) via a SERCOS ring. The module calculates the path and the interpolation for several axes (position mode). Access to the other modes (speed and torque) is possible with the assistance of Schneider Electric application services.

■ 1.5 A to 70 A permanent Lexium<sup>®</sup> 15 servo drives (equipped with SERCOS option card). The servo drives manage the position loop, speed loop and torque loop, and to help ensure power conversion to control the servo motor. The sensor feedback information is sent to the servo drive (current position, current speed)

BDH and BSH servo motors. The motors feature permanent magnets delivering a high power-to-weight ratio, resulting in excellent dynamic speed response in a compact unit.

The Lexium range offers the accessories required (line chokes, braking resistors, etc.) as well as a full set of connectors.

(1) The TSX CSY 85 module also supports path functions using the TjE path editor software.

### System overview

The system overview presents the various functions performed by the different parts of the multi-axis control system.

### Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Lexium<sup>®</sup> 15 SERCOS<sup>™</sup> TSX<sup>™</sup> CSY 84/85/164

motion control modules

### System overview (continued)

PL7<sup>™</sup> Junior/Pro or Unity<sup>™</sup> Pro software via the Premium<sup>™</sup> platform terminal port can be used to:

- Declare SERCOS<sup>™</sup> TSX<sup>™</sup> CSY 84/85/164 modules in the PLC configuration.
- Configure the functions and define the parameters for the axes used.
- Program the movements in the PLC application.
- Adjust the parameters via the operating codes (parameters,
- TSX CSY module and Lexium® 15 servo drive with SERCOS option card).
- Test and debug the application.

Unilink software, via the Lexium 15 servo drive's RS 232 terminal port (with SERCOS option card) can be used to:

Define types of Lexium 15 servo drive (with SERCOS option card) and BDH/BSH servo motor.

 Adjust the parameters for Lexium 15 servo drives (with SERCOS option card), back them up in the servo drive EEprom memory and save them on a compatible PC

### Description

TSX CSY 84/164

TSX CSY 85

- The TSX CSY 84/85/164 SERCOS axis control modules are comprised of: 1 An SMA-type connector, marked TX, for connecting the servo drives using the
- SERCOS ring fiber-optic transmission cable.
- An SMA-type connector, marked RX, for connecting the servo drives using the SERCOS ring fiber-optic reception cable.
- 3 Double format rigid casing, in order to:
- п Support electronic cards.
- Attach and lock the module in its slot.
- Module diagnostics LEDs:
- □ RUN LED (green): LED ON indicates module operating correctly.

□ SER LED (yellow): flashing LED indicates data transmission and reception on the SERCOS network.

- □ ERR LED (red):
  - LED ON indicates detected internal module fault

- flashing LED on module start-up indicates detected communication fault, incompatible configuration or application missing.

□ I/O LED (red): LED ON indicates detected external or application fault.

□ INI LED (yellow): flashing LED indicates module reinitializing.

- Channel diagnostic LEDs (green): LED ON indicates axis operating normally; 5
- OFF: detected configuration fault; flashing: serious detected error on axis: 1 to 8: display of 8 real axes (1).
- □ 9 to 12: display of 4 imaginary axes (1).
- □ 13 to 16: display of 4 remote axes (1).
- □ 17 to 20: display of 4 coordinated sets.
- □ 21 to 24: display of 4 follower sets.
- A pencil point button to reinitialize the module. 6
- Two mini DIN type 8-way connectors for Schneider Electric use. 7

(1) 1 to 16: display of 16 axes (real, imaginary or remote) with module TSX CSY 164.

motion control modules

Programming	Movements	Homing, absolute, relative, or continuous
		Immediate movement, or queued, to a given position
		Speed override possible
		Acceleration and deceleration parameters may be set for each axis motion control
		Synchronization on start or resynchronization on stop for a slave axis on a master axis in a given position
		Rollover counter
	Special functions	Position capture and distance measurement between two edges on one or two logic inputs on
		the servo drive. This can be applied to the real or remote axis (position measurement via external sensor)
		Count probe: counts the edges on a logic input on the servo drive over a period of time
		Fast index: starts a movement on an event
		Registration move: position capture on an edge of the logic input on the servo drive Rotary knife: cuts using a rotary knife. Synchronizes a circular axis on a linear axis and control a logic output on the servo drive
	Other special functions	It is possible to develop other special functions with the assistance of our application services. Please consult your Schneider Electric Regional Sales Office.
	Stop/start functions	Fast stop, stop on configured deceleration profile Temporary stop
		Restart of stopped movement
		Choice of stop method: ■ on inoperative slave: master is not stopped. Master stops normally according to pre-
		determined deceleration ramp or servo-driven master emergency stop
		<ul> <li>on inoperative master: slave stops normally according to pre-determined deceleration ramp</li> </ul>
		or servo-driven slave emergency stop
		On Emergency Stop: calculation of slave axis deceleration ramp alignment with master axis to
		obtain synchronized stopping of the axes in the set On Emergency Stop: axes may be allowed to "freewheel" or may be stopped according to a pre-determined ramp
Configuration and adjustment	t SERCOS <sup>™</sup> ring	Bus cycle time, traffic on the bus, optical power on the fiber, SERCOS loop diagnostics
	Acceleration/deceleration	Ramp values, ramp type (rectangular, triangular and trapezoid), choice of units, maximum acceleration adjustment
	Speed	Speed units, default speed, maximum speed, speed override
	Other settings	Target window, rollover, software limits
	Set of follower axes	Following of master axis by gearing or camming (cam profile), threshold position of master triggers the following, bias value when synchronizing an axis, monitoring of master/slave positions, master offset for follower axis
	Set of coordinated axes	Type of interpolation: linear
	Cam profile	Value of an existing point of a cam profile, number of points (5000 max.), type of interpolation, table addresses
	State of a movement or axis	Moving, accelerating, decelerating, homing, in position, fault detected, etc.
	Diagnostics	Servo drive fault detected, axis currently reading data, detected following error, overvoltage, undervoltage, overcurrent, power supply inoperative Availability of follower axis detected fault information for a given axis set Multi-axis motion path control according to common tolerance for the axes in the motion, with alarm feature. Only available with the TSX <sup>™</sup> CSY 164 module

### Functions specific to the TSX<sup>™</sup> CSY 85 module

Path creation using TjE editor

## The paths, whether simple or complex, are divided into linear or circular segments linked by interpolation laws of 6 possible types. Each segment is characterized by:

- The X and Y coordinates of the point to be reached (in the example on the left, P6)
- or "tangented" (P1, P2,....P5)
- The movement speed, maximum or limited according to setpoint (parameter "ParF0", see screens below):
- □ The type of interpolation (parameter "ParW0", see screens below)
- □ The number of points in the linear segment (min. 1 point)
- □ The number of points in the cubic interpolation part of the segment
- □ Various other parameters depending on the type of interpolation

#### Linear interpolation

Part#3	0						/	
Partiti	0	iii				/		
Part 3	0			H٠	4			
ParF2	0			Ľ٩				÷
8462	0			-				

This type of interpolation is used to create a rectilinear path between the preceding point  $P^{i\cdot 1}$  and point Pi defining the segment. The various parameters below are used as follows:

■ "ParW1" indicates the number of points in the linear segment. The number of points represents the number of intermediate points that the TSX CSY 85 motion control module must calculate to define the path on the segment (minimum 1).

• "ParW4" is used to indicate that the movement of a third axis will follow the path (here, the linear segment) using tangential mode: positioning according to a constant angle with the path (1).

(1) Available in the future version of the TjE software.

#### Linear interpolation with 3º polynomial interpolation connection

P1		the second s	and the second se
X Coord	- 3		00443

Perfit	- 4	Itacci: Initial Connection Lenght	10 ×
Darf 2	2	Inaccil: Final Connection Lenght	190 X
HarFit	P.		

This type of interpolation is used to create a curve between two linear segments in accordance with a  $3^{\circ}$  interpolation in order to smooth the transitions. The path no longer passes through the defined point P<sub>i</sub> (in the example on the left, P1) but follows a curve defined by the following parameters:

- "ParW2" indicates the number of points in the cubic interpolation part (curve)
- "ParW3" defines the shape coefficient of the cubic interpolation enabling the curve to move closer to or further from the defined point P<sub>i</sub>

■ "Iracc1" and "Iracc2" correspond to the initial and final connection lengths. If these lengths are too great, maximum lengths are calculated by the TSX CSY 85 motion control module as a function of the previous section for Iracc1 and of the following section for Iracc2.

### Linear interpolation with 5° polynomial interpolation connection

PMF2	1.5		Bacch: Final Connection Lenght	IIL				
Parf3								

The type of  $5^{\circ}$  polynomial interpolation is used to define a path in the same way as that using  $3^{\circ}$  polynomial interpolation.

Nonetheless, compared to a  $3^\circ$  interpolation,  $5^\circ$  interpolation helps to ensure more flexible movement.

If the acceleration limit in the segment in question is reached, however, the speed on the segment can be reduced for this type of connection.

#### Linear interpolation with circular interpolation connection

Parts	.0		

This type of interpolation is used to link segments via a circular path (circle arcs or full circles). The specific parameters defining this type of path are:

- "ParW2" indicates the number of points in the circular interpolation part
- "ParW4" defines whether the arc is greater or less than 180° (defining the arc direction)

"ParF1" corresponds to the length of the circular interpolation segment

Circular interpolation is only possible for a movement in a plane involving only 2 axes.

# Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Lexium<sup>®</sup> 15

SERCOS<sup>™</sup> TSX<sup>™</sup> CSY 84/85/164 motion control modules

#### Functions specific to the TSX<sup>™</sup> CSY 85 module (continued))

This type of interpolation is used to connect segments via a circular path (circle arcs) by specifying the start and end points, the circle radius and the path direction (clockwise or counter-clockwise). The specific parameters defining this type of path are:

- "ParW1" indicates the number of points in the circle arc
- "ParW4" defines the path direction (clockwise or counter-clockwise)
- "ParF1" corresponds to the radius of the circle arc
- Circular interpolation according to radius:
  - Is only possible for a movement in a single plane (2 axes only)
  - Cannot be used to create paths in a full circle (to do this, use linear interpolation with connection according to circular interpolation)

This type of interpolation is also used to connect segments by a circular path (circle

arcs or full circles) by specifying the start and end points, the circle center coordinates and the path direction (clockwise or counter-clockwise). The specific

#### Circular interpolation according to center

Parfi	1.5	% Coordinate Centre	10 e1x/x1 x
Parts	1.5	Y Coordinate Centre	
ParF3	0		

#### Tangential axis interpolation

parameters defining this type of path are:
"ParW1" indicates the number of points in the circle arc
"ParW4" defines the path direction (clockwise or counter-clockwise)
"ParF1" indicates the abscissa of the center of the circle (X)

"ParF2" indicates the ordinate of the center of the circle (Y)

Full circular movement is defined as the end point being the same as the start point. Circular interpolation is only possible for a movement in a single plane (2 axes only).

Tangential axis interpolation applied to a third angular axis is used to enable it to follow the path defined by the first two axes according to a constant, controlled angle. Tangential mode will be fully available in a future version.

This version V1.0 of the TSX<sup>™</sup> CSY 85 module, however, offers functions for creating tangential mode using the PL7<sup>™</sup> application.

#### TjE path editor software

The TjE path editor software supplied with the SERCOS<sup>™</sup> TSX<sup>™</sup> CSY 85 motion control module is used in offline mode to:

- Create master/slave axes and axis sets for use in the paths with a maximum of 3 sets of 2 real axes or 2 sets of 3 axes.
- Each slave axis requires a cam profile selected from the 7 profiles available in the TSX CSY 85 module (with a limit of 10,000 cam points for the profiles).
- Define paths by setting the parameters for each segment which are linked to the various possible interpolations described in pages 4/50 and 4/51 of this catalog.
- The TjE software validates the parameters and calculates the paths for each set of axes.

#### Path display

The TjE software integrates different graphic tools for displaying the previously created paths and the relevant data linked to the axes (making up the paths) with their positions, speeds or accelerations. The paths can be displayed with: A choice of curves, colors and scaling

- A choice of scales and offsets
- Display of segment reference points
- Display of points of the master, and calculated points of cam profiles

This display enables the user to validate the paths before transferring the data thus generated to the PL7 Junior/Pro application managing the SERCOS TSX CSY 85 motion control module(s).

(1) Maximum 8 real axes per TSX CSY 85 module.

Debugging in PL7 Pro software

When setting up application-specific functions, screens specific to SERCOS<sup>™</sup> motion control functions can be accessed via Unity<sup>™</sup> Pro or PL7<sup>™</sup> Junior/Pro software, for configuration, adjustment, debugging and documentation of applications. These services are performed by editors which can be directly accessed from the basic screen using icons in the tool bars. Windows relating to the editors can be simultaneously displayed on one screen (example: it is possible to program using the program editor and to simultaneously define the symbols in the variables editor).

#### **Declaring the SERCOS motion control modules**

Parameter entry for application-specific functions is accessed via the configuration screen, by clicking on the slot occupied by the module.

#### Configuring the module

The configuration editor provides assistance with entering and modifying the values of the various axis configuration parameters. These parameters help to enable the operation of the axis control module to be adapted to the machine to be controlled. The axis configuration parameters are:

- Units of measurement
- Resolution
- Maximum and minimum limit positions
- Maximum speed
- Accelerating/decelerating

This data relates to the machine and cannot be modified by the program.

The configuration screen as shown here can be used to declare the 16 axes as real, imaginary or remote measurement axes in the TSX<sup>™</sup> CSY 164 module.

#### Adjusting the modules

These parameters are associated with operation of the axes. They generally require the operations on and movements of the moving part to be known. These parameters are adjusted in online mode (they are initialized during configuration, in offline mode).

- They concern:
- Maximum speed
- Resolution
- Servo control parameters
- Accelerating/decelerating

#### Debugging the modules

In online mode, the debugging tool provides the user with a control panel screen, giving a quick display which can be used to control and observe the behaviour of the axis.

The TSX CSY 84/85/164 modules associated with the Unity Pro or PL7 Junior/Pro software provides manual mode for running continual (JOG) or incremental (INC) motion commands without prior programming.

Integrated weighing system

# Description

### Modicon<sup>®</sup> Premium<sup>™</sup> automation platform TSX<sup>™</sup> ISP *Plus* Integrated weighing system

When a **TSX<sup>™</sup> ISP Y101** weighing module is plugged into a Modicon<sup>®</sup> Premium<sup>™</sup> programmable controller, it is possible to go beyond the scope of a simple weighing application. The PLC manages not only the entire weighing environment, but also the whole of the machine or industrial process associated with the weighing system.

In a Premium configuration, the number of **TSX ISP Y101** weighing modules must be added to the other dedicated modules (TSX<sup>™</sup> SCY 21601 communication, TSX<sup>™</sup> CTY counting, TSX<sup>™</sup> CAY/CSY axis control and TSX<sup>™</sup> CFY movement control). The maximum of **TSX ISP Y101** weighing module (2 application-specific channels per module) permissible is :

- 2 dedicated modules with TSX<sup>™</sup> P57 0• processor.
- 4 dedicated modules with TSX P57 1● processor.
- 12 dedicated modules with TSX P57 2 processor.
- 16 dedicated modules with TSX P57 3● processor.
- 32 dedicated modules with TSX P57 4e/5e/6e processor.

#### **Description**

#### Weighing module

The **TSX ISP Y101** weighing module has the following on the front face:

- A SUB-D 9-way female connector for the dedicated RS 485 serial link to the weight indicator.
   A screw terminal block for connecting the 2 discrete reflex outputs (outputs used
- with threshold detection). 3 A SUB-D 15-way female connector for the indicator input channel (50 samples per
- 3 A SUB-D 15-way remain connector for the indicator input channel (50 samples per second, from 1 to 8 load cells).
- 4 Module sealing device, if required.

#### Weighing indicator

Weight values are displayed on a **TSX<sup>™</sup> XBT N410** weight indicator (supplied with the TSX ISP Y121 unit). The weight indicator is pre-configured.

It has the following on the front face:

- 1 An LCD, back-lit display screen with 4 lines of 20 characters (height 4,34 mm).
- 2 Two control or contextual link keys, non configurable
- 3 Six service keys

The back is equipped with:

A plug-in screw terminal block for --- 24 V external power supply.
 A 25-way SUB-D type female connector for connection to the TSX ISP Y101 weighing module (30 m maximum).

Strain gauge type load cells and connection accessories

Consult your Schneider Electric Regional Sales Office.

# Functions, implementation

### Modicon<sup>®</sup> Premium<sup>™</sup> automation platform TSX<sup>™</sup> ISP *Plus*

Integrated weighing system

#### **Functions**

The weighing module with its associated display unit constitutes a weighing

- indicator. The module incorporates numerous functions specific to weighing:
- Continuous weighing (in g, kg, t, lb, oz...) and flow calculation (weight variation).
   Filtering of measurements by several methods (19 filtering options).
- Filtering of measurements by several methods ( Tare (automatic/manual) and preset tare.
- Automatic reset.
- Weighing stability control.
- Three held date stion with
- Threshold detection with extrapolation of the cut-off point: positioning of local "discrete" outputs to the nearest millisecond.
- Assisted calibration: the module calculates the zero point and the gradient.

■ Calibration parameters saved in the module (EEPROM) and in the Modicon<sup>®</sup> Premium<sup>™</sup> processor.

■ Forced calibration: fast replacement of an inoperative module and restarting using the previous calibration parameters.

■ Locking of the configuration, sealing of the module and its connections to the load cells and weight indicator.

- Continuous formatting and transmission of measurements to the PLC.
- Transmission of measurement validity data (validity, stability, nett/gross...).
- Transmission of diagnostic data from the module and its connections.
- Configuration, calibration and debugging via Unity<sup>™</sup> Pro or PL7<sup>™</sup> Junior/Pro screens.

Most of the operating parameters can be modified and most of the functions can be run by PLC program.

#### Setting up the weighing module

Unity<sup>™</sup> Pro or PL7<sup>™</sup> Junior/Pro software allows complete setting up of the weighing system (configuration, calibration and debugging).

#### Configuration

- This covers:
- The measuring data of the weigher.
- Filtering of measurements.
- The flow calculation method.
- The tare.
- Data format.
- Stability criteria and zero point management method.
- Threshold monitoring for positioning of discrete outputs.

#### Weigher calibration

The module itself calculates the gain and the offset to be applied to the electronic weighing system. Calibration is carried out in two phases:

- Measurement of the dead load.
- Measurement of a standard weight.

Forced calibration allows immediate restarting of the system in the event that a module becomes inoperative; the new module is configured automatically.

#### Debugging

The dedicated weighing screen provides the following dynamic display:

- The measurement in progress.
- The operating state of the module.

It also allows fast modification of setting parameters (filtering, flow, threshold values...).

Instructions and parameters that can be modified by the program in real time with the module.

These parameters and instructions can be monitored from an operator dialog type device and/or a supervisory device connected to the Premium.

# Presentation

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Hot Standby system

Unity<sup>™</sup> Pro software

"Primary" Modicon Premium

"CPU Sync" link

**Presentation** 

The Modicon® Premium<sup>™</sup> Hot Standby redundancy system is compatible with Unity<sup>™</sup> Pro software. It helps to ensure continuity of operation for an automation system based on the Modicon Premium platform in the event that one of the following becomes inoperative:

- The central processing and communication functions
- The I/O system

It is based on the "Primary/Standby" redundancy principle, with complete redundancy of the main processing and communication functions, the use of shared I/O on the Ethernet Modbus®/TCP network, a Modbus® link and/or redundancy of in-rack I/O (single-rack configuration only).

Premium Hot Standby redundant architectures offer an ideal solution for availability requirements when changeover time is not critical. They are designed for processes which can tolerate a lack of control on the part of the Premium<sup>™</sup> PLC lasting up to one second (average changeover time from the "Primary" unit to the "Standby" unit and for updating shared I/O on Ethernet).

They can meet availability requirements when the purpose of the PLC is to monitor and control an installation in continuous operation, signal incidents to a control station, and transmit command instructions from the supervision manager to various locations on an extensive site

Example areas of application:

- Centralized technical management of a public facility (tunnel, airport, signals, etc.)
- Control/monitoring of a water treatment or distribution station
- Electrical technical management
- Hydroelectric power production

#### Principle

At the center of the system, there are two Modicon Premium single-rack configurations called the "Primary" PLC and the "Standby" PLC. Their hardware and software configurations are identical (i.e. identical modules in each rack). The offer is comprised of two processor models (TSX H57 24M and TSX H57 44M) designed specifically for Hot Standby architectures with Unity Pro software (version  $\ge 3.1$ ). This dual processor configuration combines the functions of the CPU and redundant coprocessor in the same unit.

The "Primary" PLC:

Executes the application program and manages the I/O, which can take the form of:

□ Field devices on an Ethernet network managed by the I/O Scanning service (see page 5/30)

□ Field devices on a Modbus® master link

□ Sensors and actuators connected to Premium I/O modules on bus X with single-rack configuration

Manages the transfer of data via the "CPU Sync" link to the "Standby" PLC at the start of every cycle

In the event the "Primary" PLC becomes inoperative, the standby system changes over automatically, whereby execution of the application program and control of the I/O is changed over to the "Standby" PLC within 1.5 cycles, with an up-to-date data context.

An automatic mechanism for the assignment of "IP" and "IP + 1" addresses changes the addresses of the Ethernet network modules with the 2 Premium configurations which manage the field devices. The same mechanism is used for "n" and "n + 1" slave address assignments for Modbus link modules.

Once they have changed over, the "Standby" PLC becomes the "Primary" PLC. Once the inoperative PLC has been repaired and reconnected to the standby system, it takes the role of the "Standby" PLC.

# Modicon<sup>®</sup> Premium<sup>™</sup> automation platform

Hot Standby system

Unity<sup>™</sup> Pro software

TSX H57 24M/44M

#### Hot Standby processors TSX<sup>™</sup> H57 24M/44M

The double-format Modicon<sup>®</sup> Premium<sup>™</sup> Hot Standby processors TSX<sup>™</sup> H57 24M and TSX<sup>™</sup> H57 44M display the following features on the front panel: 1 Display unit consisting of six LEDs:

- RUN LED (green):
- LED permanently on: Processor in "Primary" mode during operation (program running)
- □ Flashing 2.5 s (on)/0.5 s (off): Processor in "Standby" mode during operation (execution of first program section)
- E Flashing 0.5 s (on)/2.5 s (off): Processor not in standby mode
- □ Flashing 0.5 s (on)/0.5 s (off): PLC in Stop mode
- ERR LED (red):

LED permanently on: Detected fault on the processor or its on-board devices (PCMCIA memory card)

- □ Flashing 0.5 s (on)/0.5 s (off): Detected application fault
- TER LED (yellow): Activity on the TER/AUX terminal port

■ I/O (red), permanently on: Detected fault on another module on the PLC station,

- or detected configuration fault
- STS LED (yellow):

 $\square$  Flashing 0.5 s (on)/0.5 s (off): Redundant mode between the "Primary" and "Standby" processors is OK

LED permanently on: Standby mode not active or being initialized

Off: Processor does not pass self test

■ ACT LED (yellow): Activity on the "CPU Sync" link between the "Primary" and "Standby" processors is OK

Diagnostics at redundancy mode level is supported by the 3 LEDs (RUN, ERR and STS) on the TSX<sup>™</sup> ETY 4103/5103 communication modules managing the shared I/O on Ethernet.

- 2 Memory Extract button: Not operational on Hot Standby processors
- 3 RESET button which initiates a cold restart of the PLC when activated
- 4 8-way female mini-DIN connector marked TER/AUX for connecting a programming, adjustment or user interface terminal
- 5 USB connector marked TER for connecting a programming terminal (requires UNY XCA USB 033 3.3 m connection cable for connection to a compatible PC; to be ordered separately)
- 6 PCMCIA slot (no. 0) for a memory extension card
- 7 PCMCIA slot (no. 1) for a memory extension card to store additional data (1)
- 8 RJ45 connector marked HSBY Link, designed for Hot Standby communication between the "Primary" and "Standby" processors

#### "CPU Sync" link

The "CPU Sync" link 8 (marked HSBY Link) on the front panel of Hot Standby processors is an Ethernet 10BASE-T/100BASE-TX port dedicated to data exchange between the "Primary" and "Standby" PLCs on the standby system. This link is used by the active "Primary" PLC (from the point of view of the system I/O) to replicate its context (status of its data) with the "Standby" PLC on every application cycle in such a way that, in the event of a changeover triggered by the "Primary" PLC becoming inoperative, the "Standby" PLC can take control of the automation system within 1.5 processor cycles.

The "CPU Sync" link is a copper link with a maximum length of 100 m.

 $\triangle$  The use of active components (transceivers, switches, ...) on "CPU Sync" link is strictly forbidden.

#### **USB** port

The USB port **5** with a useful data rate of 12 Mbit/s is compatible with Unity<sup>™</sup> Pro programming software and OPC Factory Server (OFS)<sup>™</sup> software. TSX<sup>™</sup> H57 24M/44M processors can be connected to a USB bus with several peripheral devices. However:

Only one processor can be connected to the USB bus.

■ None of the equipment on the USB bus (such as the modem or printer) can be controlled by the PLC.

<sup>(1)</sup> PCMCIA communication cards, reference TSX<sup>™</sup> SCP 11● (Modbus<sup>®</sup>, Uni-Telway<sup>™</sup>, serial link), TSX<sup>™</sup> CPP 110 (CANopen), TSX<sup>™</sup> FPP 20 (Fipway<sup>®</sup>) and TSX<sup>™</sup> MBP 100 (Modbus Plus<sup>™</sup>), are not authorized for use in slot 1 on Hot Standby processors.

# Modicon<sup>®</sup> Premium<sup>™</sup> automation platform

Hot Standby system Unity<sup>™</sup> Pro software

### Architectures

#### **Typical architecture**

In this type of architecture, the I/O system in Modicon<sup>®</sup> Premium<sup>™</sup> PLCs equipped with a dedicated Hot Standby TSX™ H57 24M/44M processor is defined by the distribution of field devices or equipment on the Ethernet Modbus®/TCP network. From an operational point of view, the following devices or equipment are connected on the same Ethernet network:

■ Client: Twido<sup>®</sup> controller, Modicon<sup>®</sup> Premium<sup>™</sup> PLC, Magelis<sup>®</sup> HMI, W@de remote management module, etc.

■ Modbus/TCP server: Advantys<sup>™</sup> OTB/Momentum<sup>™</sup> distributed I/O, Advantys STB I/O islands, Altivar® variable speed drives, Lexium® servo drives, Inductel/Ositrack identification systems, etc.

The Ethernet I/O Scanning service enables client-server exchanges between a PLC and Ethernet equipment communicating by means of the Modbus/TCP protocol. This service can be used to define up to 64 periodic read or write exchanges in the form of a configuration, based on tables of (word type) variables for target devices or equipment. The I/O Scanning service is a function that is available as standard with TSX<sup>™</sup> ETY 4103/5103 Ethernet network modules.

#### Elements for redundancy

- 6, 8 or 12-position non-extendable rack TSX™ RKY ●
- Power supply module TSX<sup>™</sup> PSY ●●●M
- Premium Hot Standby processor TSX H57 24M/44M 3
- Ethernet network module TSX ETY 4103/5103 4 (version ≥ sv 4.0)

#### Ethernet ring shared elements

- 15 Modicon M340 automation platform featuring processor with built-in Ethernet port BMXP34 2020/2030
- 16 Advantys STB modular distributed I/O with network interface module STB NIP 2212
- 17 Altivar 61/71 variable speed drive with communication card VW3 A3 310
- 18 Advantys OTB Optimum distributed I/O with interface module OTB 1E0 DM9LP
- 19 Magelis XBT GT graphic terminal with on-board Ethernet port XBT GT ••30/40
- Other possible shared elements:
- Advantys FTM, IP 67 modular I/O
- Momentum distributed I/O
- TSX ETG 100/1000 gateway for connecting Modbus devices
- W@de remote management modules (RTU), designed for water applications TSX HEW 315/320/330
- Inductel/Ositrack identification system XGK S1715503 and XGK Z33ETH
- \_exium servo drives with communication card
- AMO ETH 001V000
- Preventa XPS MF compact and modular safety PLCs

#### Ethernet wiring elements: 10 ConneXium<sup>™</sup> managed switch with 2, 4 or 8 10/100BASE-TX

- ports TCS ESM 0.3
- 11 CPU Sync link, copper crossover cable 490 NTC 000 •••
- 12 Copper straight-through cable 490 NTW 000 •••
- 13 Copper crossover cable 490 NTC 000 ••• (1)
- (1) For Ethernet ring lengths > 100 m, the copper link is replaced by a multimode optical fiber link (max. 3 km) or a single-mode optical fiber link (max. 20 km) by using ConneXium switches TCS ESM 043F2CS0 with a copper straight-through cable 490 NTW 000 ••• (optical fiber is not included in Schneider Electric's scope of supply).

Note: In cases where other "Primary" and "Standby" PLC Ethernet modules are required to be "monitored", in order to extend the redundancy field (for the Ethernet SCADA network, for example), an application program must be written in each PLC.

The Ethernet network topology for connecting Ethernet Modbus/TCP modules on PLCs to distributed devices/equipment can be a bus or ring type topology with a copper or fiber-optic cable.

#### "Monitored" Ethernet network modules

When configuring the Hot Standby system using Unity<sup>™</sup> Pro software, an Ethernet module (4-M) located on both the "Primary" and the "Standby" PLCs, must be defined as having the status "monitored" and use the Ethernet I/O Scanning service. This status assigns the module with the task of monitoring that it is functioning correctly, as well as monitoring its electrical link to its Ethernet switch. A detected failure (affecting the "monitored" module or its Ethernet link) will trigger a Hot Standby changeover from the "Primary" PLC to the "Standby" PLC.

- 13 Copper crossover cable 490 NTC 000 ••• (1)

#### Human Machine Interface:

19 Magelis XBT GT graphic terminal with on-board Ethernet port XBT GT ••30/40

(1) See Note (1) on page 4/62 of this catalog.

#### Management of redundant I/O

Each "Primary" and "Standby" Premium<sup>™</sup> PLC has a group of identical I/O modules on its TSX<sup>™</sup> RKY ● rack.

The discrete sensors/actuators are connected to 16-channel Advantys<sup>™</sup> Telefast<sup>®</sup> passive or adaptor sub-bases ABE 7H16/S16/R16.

The analog sensors/actuators are connected via a JM Concept converter. Visit www.imconcept.com

For redundant inputs, the sensor information is transmitted simultaneously to the "Primary" and "Standby" PLCs via the 2 identical input modules placed in the Premium racks. Two Advantys Telefast ABE 7 16-channel sub-bases, ABE 7ACC11 with redundant inputs and ABE 7ACC10 with redundant outputs, can be used to achieve this double wiring easily using cables equipped with HE 10 connectors. The output values are generated solely by the application processing of the "Primary" PLC, which sends its commands to the corresponding output modules. During each cycle, the "Standby" PLC receives the "Primary" PLC's output values via the CPU Sync link and applies them to its own outputs. This update enables "Normal/ Standby" changeover to take place smoothly during the changeover time.

**Note**: Output fallback values: Within a Hot Standby system, the redundant output modules must be configured with fallback to 0, while the outputs of the shared elements (on Ethernet I/O Scanning or Modbus) must be configured to maintain their state.

Note: When using TSX PAY 262/282 Preventa safety modules: Within a Hot Standby system, the modules are authorized in the Premium racks subject to compliance with the wiring recommendations. Please consult your Regional Sales Office.

# Modicon<sup>®</sup> Premium<sup>™</sup> automation platform

Hot Standby system Unity<sup>™</sup> Pro software

#### Architectures (continued)

#### SCADA architecture on Modbus® and shared I/O on Ethernet Modbus/TCP

As in the typical architecture shown on page 4/62 of this catalog, the I/O in the Modicon<sup>®</sup> Premium<sup>™</sup> Hot Standby system is shared on an Ethernet network (with a bus topology as shown in the example below). However, the SCADA interface is connected to the standby system via a Modbus serial link.

The Ethernet Modbus/TCP network modules are configured to be "monitored" so that they can trigger a Hot Standby changeover in the event of a detected failure (of the Ethernet module or electrical link and its switch). See page 4/62, 4 - M

#### Elements for redundancy:

SCADA supervision system

In this type of architecture, the redundancy of the SCADA station, which is based on Vijeo<sup>®</sup> Citect<sup>®</sup> or Monitor Pro supervision software, is provided by a Modbus<sup>®</sup> serial link on which the SCADA station is the master. Via their TSX SCY 21601 communication module, equipped with a TSX SCP 114 PCMCIA RS 485 card, the "Primary" and "Standby" PLCs have the slave addresses "n" and "n + 1" respectively.

A detected failure triggers a changeover from the "Standby" to the "Primary" PLC and brings about an automatic change in the Modbus addresses: The address of the new "Primary" PLC becomes "n" and the address of the old one becomes "n+1".

## Architectures (continued)

# Modicon<sup>®</sup> Premium<sup>™</sup> automation platform

Hot Standby system Unity<sup>™</sup> Pro software

#### Architectures (continued)

Shared devices on Modbus  $\ensuremath{^\circ}$  , and shared I/O on Ethernet Modbus/TCP

In this type of architecture, the devices, peripheral devices or equipment in the Modicon<sup>®</sup> Premium<sup>™</sup> Hot Standby redundant system are:

Shared on an Ethernet network (with a bus topology as shown in the example below)

■ Shared on a Modbus<sup>®</sup> link, and can thus support a large number of diverse peripheral devices or items of equipment (Schneider Electric or third-party) equipped with a Modbus slave interface

As with the previous types of architecture, this type can support a SCADA supervision system on Ethernet or Modbus.

#### Elements for redundancy

- 1 6, 8 or 12-position non-extendable rack TSX<sup>™</sup> RKY ●
- 2 Power supply module TSX<sup>™</sup> PSY ●●●M
- 3 Hot Standby processor TSX<sup>™</sup> H57 24M/44M
- 4 Ethernet network module TSX<sup>™</sup> ETY 4103/5103 (version ≥ sv 4.0)
- 7 Communication module TSX<sup>™</sup> SCY 11601/21601 whose integrated channel is used in the Modbus master

#### Shared elements on Modbus®: Examples

- TeSys<sup>®</sup> U starter-controllers
- PowerLogic® PM500 LV/MV power meters
- Preventa<sup>™</sup> XPS MC safety controllers

#### Shared elements on the Ethernet network

- 15 Modicon<sup>®</sup> M340<sup>™</sup> automation platform featuring processor with integrated Ethernet port BMX P34 2020/2030
- 16 Advantys<sup>™</sup> STB modular distributed I/O with network interface module STB NIP2212
- 17 Altivar® 61/71 variable speed drive with communication card VW3 A3 310
- 18 Advantys<sup>™</sup> OTB Optimum<sup>™</sup> distributed I/O with interface module **OTB 1E0 DM9LP**
- 19 Magelis<sup>®</sup> XBT GT graphic terminal with on-board Ethernet port XBT GT ••30/40

#### Ethernet wiring elements

- 10 ConneXium<sup>™</sup> unmanaged switch with 5 10BASE-T/100BASE-TX ports 499 NES 251 00
- 11 CPU Sync link, copper crossover cable 490 NTC 000 •••
- 12 Copper straight-through cable 490 NTW 000 •••
- 13 Copper crossover cable 490 NTC 000 •••

#### Modbus wiring elements

- 31 Passive junction box TSX<sup>™</sup> SCA 50, connection via screw terminals with line termination
- 32 Junction box with line isolation TWD<sup>™</sup> XCA ISO, connection of trunk cable via screw terminal and of 2 tap-offs via RJ45 connector
- 34 RS 485 double shielded twisted pair trunk cable TSX SCA 100/200/500 (length 100, 200 or 500 m)
- 35 Tap cable for integrated channel TSX SCY CM 6030 (length 3 m), 25-pin SUB-D connector with flying leads at one end

#### Redundant I/O on Modbus

In this type of architecture, the peripheral devices or equipment are shared by the Modbus link on which the two PLCs ("Primary" and "Standby") are masters. The other peripheral devices or equipment connected to the Modbus link are slaves. Each Premium PLC has a **TSX** SCY 11601 or TSX SCY 21601 communication module **7** with an integrated isolated RS 485 link (25-pin SUB-D connector).

The **TSX SCA 50** splitter box **31** positioned at the level of each Premium PLC ("Primary" and "Standby") includes the line termination. In addition, the TSX SCY 11601/21601 communication modules polarize the Modbus line. Disconnecting a slave during operation will not impair Modbus communication in any way.

# Modicon<sup>®</sup> Premium<sup>™</sup> automation platform

Hot Standby system Unity<sup>™</sup> Pro software

#### Functions

#### Functions of "Primary" and "Standby" PLCs

"Primary" and "Standby" PLCs are physically and functionally identical; the difference in their roles lies in their status ("Primary" or "Standby").

#### "Primary" Premium" PLC

- Executes the entire application program
- Updates the inputs and outputs according to the in-rack architecture selected on
- Bus X, Modbus<sup>®</sup> and/or Ethernet network Facilitates communication with peripheral devices
- Facilitates communication with perpheral devices
   Sends its data to the "Standby" PLC via the dedicated "CPU Sync" link and
- retrieves diagnostic information from the "Standby" PLC.
- Generates its own diagnostic information as well as that of the Hot Standby

#### architecture

#### "Standby" Premium<sup>™</sup> PLC

- Reads the state of the in-rack inputs on bus X of the "Standby" PLC
- Reads the image of the "Primary" PLC inputs (in-rack inputs on bus X, Modbus and/or Ethernet)
- Executes the application in part (only the first section of the program)
- Updates the image of its outputs according to the execution of the first section of the program
- Facilitates communication with peripheral devices
- Retrieves diagnostic information from the "Primary" PLC
- Generates its own diagnostic information as well as that of the Hot Standby architecture

#### Management of "Primary/Standby" states

One of the following elements becoming inoperative:

- □ Main rack power supply
- PLC processor

The TSX<sup>™</sup> ETY 4103/5103 "monitored" Ethernet Modbus/TCP network module automatically triggers a "Primary/Standby" changeover. For all other elements, "Primary/Standby" changeover can be customized via the application program (manual changeover).

#### Management of shared I/O on Ethernet network

The "Primary" PLC can easily be configured to manage the exchange of shared I/O states on the Ethernet network (bus or ring type). Thanks to the advanced I/O Scanning service, there is no need for specific programming.

Only the "Primary" PLC reads the physical inputs on the network and controls the/ physical outputs on it.

During each cycle, the "Standby" PLC receives the images of the I/O on the Ethernet network from the "Primary" PLC via the dedicated "CPU Sync" link. This updating of the memory facilitates smooth "Primary/Standby" changeover during the changeover time (devices or equipment maintaining their state on fallback).

#### Management of redundant I/O

For redundant inputs, sensor information is transmitted simultaneously to the "Primary" and "Standby" PLCs via the input module placed in the racks of each PLC. The output values are generated solely by the application processing of the "Primary" PLC, which sends its commands to the corresponding output modules. During each cycle, the "Standby" PLC receives the "Primary" PLC output values via the dedicated "CPU Sync" link and applies them to its own outputs. This update method facilitates smooth "Primary/Standby" changeover during the changeover time (outputs with fallback to 0).

#### Management of supervision transparency (SCADA)

Another pair of TSX<sup>™</sup> ETY 4103/5103 Ethernet Modbus/TCP modules helps to ensure transparent communication with level 2 (supervisor, third-party device, etc) during changeover of the PLC in "Primary" mode to the PLC in "Standby" mode. Communication with a redundant architecture is, therefore, similar to that with a standard architecture. This transparency is the result of the automatic mechanism for the assignment of "IP" and "IP + 1" addresses.

It can also be achieved on Modbus by using the TSX SCP 114 PCMCIA card (Modbus slave protocol in RS 485) installed in the TSX SCY 21601 communication module (automatic mechanism for the assignment of "n" and "n + 1" slave addresses).

Modbus/TCP modules within the Hot Standby architecture
Standard Web: "Rack Viewer" and "Data Editor"
FactoryCast <sup>™</sup> configurable Web (TSX ETY 5103 only)
User Web pages (8 MB with TSX ETY 5103)
Modbus <sup>®</sup> /TCP messaging
HTTP, FTP, XIP, Telnet
I/O Scanning

NTP time synchronization (with TSX ETY 5103) SMTP e-mail notification (via Unity<sup>™</sup> Pro function blocks) Network manager, SNMP agent

# Functions (continued), dimensions

# Modicon<sup>®</sup> Premium<sup>™</sup> automation platform

Hot Standby system Unity<sup>™</sup> Pro software

### Functions (continued)

#### Memory space

The memory space reserved for the application program and the data is managed by the Hot Standby system with Unity<sup>™</sup> Pro software. With an on-board RAM memory of 192 or 440 Kb (depending on the model), the RAM memory on **TSX<sup>™</sup> H57 24M** and **TSX<sup>™</sup> H57 44M** processors dedicated to Hot Standby applications can be increased for the application program to 768 or 2048 Kb (depending on the model) by adding a PCMCIA memory card.

#### Configuration

Installation of the application program does not differ fundamentally from installing a simple PLC program. It essentially uses the information requested by dedicated dialog boxes, which must be entered at configuration stage in the Unity Pro software.

#### Cyclic transfer of the application context

At the start of each scan cycle, the content of the data memory in the "Primary" PLC is transferred to the "Standby" PLC via the dedicated "CPU Sync" link, at the same time as the content of the tables containing the images of the input/output states are transferred to it. The Hot Standby system is thus able to transfer a data zone (I/O image, located (1) and unlocated internal data) from the "Primary" PLC to the "Standby" PLC comprising: 192 Kb max. with the **TSX H57 24M** processor 440 Kb max. with the **TSX H57 44M** processor

The exchange principle is illustrated in the diagram opposite, along with the exchange times according to data volume, where:

Hot Standby system: 10 ms for 100 Kb

Data transfer via the coprocessor: 30 ms for 100 Kb. This data transfer takes place in parallel with the execution of the "Primary" PLC application program.

(1) The first 100 %MW words in each located data zone are not exchanged. Therefore, they can be assigned to data for a specific process on the "Primary" or "Standby" PLC.

Presentation

# Modicon<sup>®</sup> Premium<sup>™</sup> automation platform

Warm Standby system PL7<sup>™</sup> Pro software

#### Presentation

Compatible only with the **PL7<sup>™</sup> Pro** software, the Modicon<sup>®</sup> Premium<sup>™</sup> Warm Standby redundancy system helps to ensure continuity of operation for a control system based on a Premium platform in the event one of the following becomes inoperative:

- Central processing and communication functions.
- The I/O system.

It is based on the "Normal/Backup" redundancy principle with complete redundancy of the main processing and communication functions, the use of simple I/O shared on a Fipio<sup>®</sup> bus and/or redundancy of in-rack I/O.

It covers the availability requirements when the purpose of the PLC is to monitor an installation in continuous operation, signal incidents to a control station, and transmit command instructions from the supervision manager to various locations on an extensive site. It is aimed at processes which can tolerate a lack of control on the part of the PLC lasting 1 to 2 s (average time for changeover from the "Normal" to the "Backup" unit).

Areas of application:

- In the commercial sector:
- □ centralized technical management of a public facility (tunnel, airport, etc),
- control/monitoring of a water treatment or distribution station,
- electrical technical management.
- In the industrial sector:
- □ food and beverage processing,
- □ slow chemical processes,
- □ level/temperature monitoring, etc.

# Modicon<sup>®</sup> Premium<sup>™</sup> automation platform

Warm Standby system

PL7<sup>™</sup> Pro software

#### **Principle**

The Premium Warm Standby architecture combines physical redundancy of the PLC with "Normal/Backup" type operation.

Only the "Normal" PLC processes the application and generates the outputs. The "Backup" PLC applies the outputs generated by the "Normal" PLC, performs self-diagnostics and permanently diagnoses the "Normal" PLC

In event of a malfunction on the "Normal" PLC, the "Backup" PLC takes control and then becomes the "Normal" PLC (the inoperative PLC, previously "Normal", becomes the "Backup").

Optimum availability of the application is provided by:

- Automatic or manual "Normal/Backup" changeover.
- Smooth changeover on the actuators.
- Updating of the "Backup" PLC on each cycle.
- Signalling of the inoperative component.
- Online repair.
- Transparent supervision (SCADA).

Elements which can be redundant are:

- The main rack.
- The main rack power supply.
- The processor.
- Possibly accompanied by:
- Discrete input modules.
- Discrete output modules.
- One or more extendable racks with their power supply.
- One or more Ethernet network or Modbus<sup>®</sup> bus communication modules.

Elements of the Fipio® bus shared between the "Normal" and "Backup" PLCs are: ■ Discrete or analog input modules (Advantys<sup>™</sup> STB or Momentum<sup>™</sup>) (1).

- Discrete or analog output modules (Advantys STB or Momentum) (1).
- One or more TSX Micro<sup>™</sup>/Premium<sup>™</sup> agent PLCs (these can support the entire range of I/O: discrete, analog or application-specific).

(1) TBX distributed I/O legacy modules are also possible as shared elements .

Schneider

**Functions** 

# Modicon<sup>®</sup> Premium<sup>™</sup> automation platform

Warm Standby system

PL7<sup>™</sup> Pro software

#### Functions

#### "Normal" and "Backup" PLC functions

The "Normal" and "Backup" Modicon<sup>®</sup> Premium<sup>™</sup> PLCs are physically and functionally identical, but their role is differentiated according to their status: "Normal" or "Backup". The "Normal" Premium<sup>™</sup> PLC:

- Executes the application.
- Updates the outputs and inputs (in-rack and on the Fipio<sup>®</sup> bus).
- Provides communication functions with peripheral devices.
- Sends its database to the "Backup" PLC.
- Recovers diagnostic information from the "Backup" PLC.

■ Generates its own diagnostic information as well as that of the Premium Warm Standby architecture.

- The "Backup" Premium<sup>™</sup> PLC:
- Executes part of the application.
- Reads the state of the in-rack inputs.

■ Updates its in-rack and Fipio outputs according to the state of those of the "Normal" PLC.

Provides communication functions with peripheral devices.

■ Recovers diagnostic information from the "Normal" PLC.

■ Generates its own diagnostic information as well as that of the Premium Warm Standby architecture.

#### Management of shared I/O on Fipio bus

The Fipio<sup>®</sup> bus manages I/O exchanges on Fipio devices. The "Normal" PLC is an arbitrator for the active Fipio bus while the "Backup" PLC is an arbitrator for the passive Fipio network.

Due to the characteristics of the Fipio bus, only the "Normal" PLC reads the physical inputs on the Fipio bus and controls the physical outputs on the Fipio bus. The "Backup" PLC does not access the Fipio bus.

During each cycle, the "Backup" PLC receives the values of the I/O on the Fipio bus from the "Normal" PLC via the inter-PLC Ethway link (TSX ETY 110WS module) and applies them to its own outputs. This updating of the memory enables smooth "Normal/Backup" changeover by maintaining the state of the I/O during changeover.

#### Management of "Normal/Backup" states

Malfunction of one of the following elements automatically causes a "Normal/Backup" changeover:

- Main rack power supply.
- PLC processor.
- TSX<sup>™</sup> ETY 210 communication module.
- Fipio bus connected to the integrated processor port.

For other elements, "Normal/Backup" changeover can be customized (manual changeover).

#### Management of optional redundant I/O

For redundant inputs, the sensor information is transmitted simultaneously to the "Normal" and "Backup" PLCs via the 2 input modules placed in each PLC. Two Advantys<sup>™</sup> Telefast<sup>®</sup> 16-channel sub-bases, **ABE 7ACC10** with redundant inputs and

ABE 7ACC11 with redundant outputs, can be used to perform this double wiring easily using preformed HE 10 connector connection cables, (see page 4/75 of this catalog, refs. 14, 15, 20 and 21).

The output values are only generated by the application processing of the "Normal" PLC. This sends its commands to the corresponding output modules.

During each cycle, the "Backup" PLC receives the "Normal" PLC output values via the inter-PLC Ethway<sup>™</sup> link (**TSX ETY 110WS** module) and applies them to its own outputs. This updating enables smooth "Normal/Backup" changeover by maintaining the state of the outputs during changeover.

#### Management of supervision transparency (SCADA)

Transparent communication with level 2 (supervisor, third-party device, etc) during changeover of the PLC in "Normal" mode to the PLC in "Backup" mode is provided by the **TSX™ ETY 210** Ethernet modules, using a unique IP address. Communication with a redundant architecture is therefore similar to that for a simple architecture. This transparency is identical in Modbus® with the use of the **TSX™ SCP 114** PCMCIA card (Modbus protocol in RS 485) installed in the

TSX<sup>™</sup> SCY 21601 communication module.

# Modicon<sup>®</sup> Premium<sup>™</sup> automation platform

Warm Standby system

PL7<sup>™</sup> Pro software

#### Functions

#### Ring topology for shared equipment on the Fipio® bus

To improve the availability of shared equipment on the Fipio bus, it is possible to create a Fipio redundant ring using fiber-optics. The fiber-optic ring can then be used to: Maintain normal operation in the event of a break at some point on the fiber-optic medium.

■ Increase the immunity of the Fipio bus in environments with high levels of electromagnetic interference.

1 OZD FIP G3 fiber-optic transmitter (see page 5/85).

#### Software setup

Modicon<sup>®</sup> Premium<sup>™</sup> Warm Standby redundant architecture is set up using **PL7<sup>™</sup> Pro** software (1), in exactly the same way as a standard non-redundant process is set up. It is, however, necessary to apply the rule that the application program of both the "Normal" and "Backup" PLCs must be completely identical.

Redundancy entails certain special features which, if taken into account at the start of the development task, are very simple to set up using the additional Premium Warm Standby application design software **TLX CD WSBY P40E**.

This software can be perform the following functions:

- Taking account of Normal/Backup states during program execution.
- Sharing the database between the 2 PLCs via DFB user function blocks and EF elementary function blocks.
- Management of redundant in-rack I/O.
- Management of shared I/O on the Fipio bus.

(1) Warm Standby non compatible with Unity<sup>™</sup> Pro software.

References				
	Description	Туре	Reference	Weight kg
Readyrent	Software package for setting up a Warm Standby redundant architecture on Premium	Equipment with 1 station (equiped with PL7 Pro software)	TLX CD WSBY P40E	_
TSX ETY 210	Ethernet Modbus®/TCP communication module for Premium <sup>™</sup> Warm Standby redundant architecture	Identical to those of the TSX ETY 110WS module (see page 5/45). For the Warm Standby architecture, this module also provides: - transparent addressing during changeover - diagnostics of the architecture (self-tests, state of the Ethernet link and of the TSX ETY 210 dual module), - Ia maintenance with access to the "backup" PLC	TSX <sup>™</sup> ETY 210	0.270

#### Additional compatible elements

The Warm Standby architecture presented on page 4/71 of this catalog shows the essential elements for redundancy. Compatible standard modules can be added to this minimum configuration according to the requirements of the process being automated.

#### Elements for redundancy (sold in lots of 2) (1)

- Bus X remote system:
- □ TSX<sup>™</sup> REY 200 Bus X remote module, for increasing the length of Bus X to 2 x 350 m.
- Communication:
- □ TSX<sup>™</sup> ETY 210 Ethernet communication module, for communication with level 3,

□ TSX<sup>™</sup> SCP 114 Modbus communication PCMCIA card, for Modbus<sup>®</sup> Slave communication with transparent addressing for third-party devices. This card should be inserted in the slot in the TSX SCY 21601 communication module.

Discrete and analog I/O:

□ TSX<sup>™</sup> DEY ●●K discrete input modules with HE 10 connectors with ABE 7ACC11 Advantys<sup>™</sup> Telefast<sup>®</sup> redundant sub-bases,

□ TSX<sup>™</sup> DSY ●●K discrete output modules with HE 10 connectors with ABE 7ACC10 Advantys Telefast redundant sub-bases,

□ TSX<sup>™</sup> DMY ● K discrete mixed I/O modules with HE 10 connectors with ABE 7ACC11/10 Advantys Telefast redundant sub-bases.

#### Shared elements on the Fipio bus

- Advantys<sup>™</sup> STB distributed I/O modules:
   □ STB NFP 2212 Fipio interface module,
- □ STB DDI/DAI/DDO/DAO/DR● discrete I/O modules,
- □ STB AVI/ACI/ART/AVO/ACO analog I/O modules,
- TSX EEF/ESF/EMF dust and damp proof discrete I/O base units.
- Momentum<sup>™</sup> I/O modules:
- □ 170 FTN 110 01 Fipio communication module,
- □ 170 ADI/ADO/ADM discrete I/O base units,
- □ 170 AAI/AAO/AMM analog I/O base units.
- Fipio® agent PLCs:
- □ Modicon<sup>®</sup> Premium<sup>™</sup> PLC, can accommodate I/O and application-specific modules,
- □ TSX Micro<sup>™</sup> PLC, can accommodate I/O and application-specific modules.
- Other shared elements:
- DZF FIP G3 fiber-optic transmitter, can be used to create a Fipio bus fiber-optic ring,

□ TSX FPACC 6 Fipio electrical repeater, increases the length of the bus by the creation of segments, each 1000 m maximum.

(1) The TSX AEY/ASY I/O analog modules, the TSX CTY/CCY/CAY/CSY/CFY/ISP Y application-specific modules are no redundancy elements. They can be used as shared elements with Fipio agent Premium PLCs

Architecture

### Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Ethernet Modbus<sup>®</sup>/TCP network

Ethernet Modbus<sup>®</sup>/ICP network Logical Ethernet communication architecture

MES: Manufacturing Execution System (production management system) ERP: Enterprise Resource Planning (integrated management software packages) HMI/SCADA: Human/Machine Interface/Supervision Control And Data Acquisition Gateway: Bridge to sensor/actuator bus, to installed base network, field bus, etc.

Ethernet Modbus<sup>®</sup>/TCP network Physical Ethernet communication architecture

(1) In general, several collision domains should be defined in order to increase the architecture surface and improve performance. See pages 9/12 to 9/17.

Transparent Ready<sup>®</sup>, system approach FactoryCast<sup>™</sup> Web servers and gateways

#### alone unit:

- □ A modem (depending on the version)
- □ An RAS/Router function
- □ A customizable Web server
- □ HMI functions (depending on the version)

FactoryCast Gateways are a cost-effective response to requirements for remote access to customized remote diagnostics, maintenance, monitoring and control services using a simple Internet browser as well as to requirements to integrate serial installations (Modbus RTU or Uni-Telway) in an existing Ethernet Modbus/TCP infrastructure.

#### **Presentation of the Web services**

#### Standard Web services

Standard Web services are integrated in the following Schneider Electric Ethernet products: automation platform processors and Ethernet modules, distributed I/O modules, variable speed drives and Ethernet gateways. See page 9/15 in this catalog.

Using a simple Internet browser, the standard Web server provides the following "ready-to-use" functions:

- Product configuration
- Remote diagnostics and maintenance of products
- Display and adjustment of products (read/write variables, status)

The embedded Web server is a real-time data server. The data can be presented in the form of standard Web pages in HTML format and can therefore be accessed using any Web browser that supports the embedded Java® code. The standard functions provided by the Web server are supplied "ready-to-use" and therefore do not require any programming of either the PLC or the client PC device supporting a Web browser.

(1) In order to simplify choice and to help ensure their interoperability within a system, each Transparent Ready product is identified by the class of services it provides. Letter A, B, C or D (level of service for the Web server) followed by 10, 20 or 30 (level of service for Ethernet communication).

(2) HMI = Human Machine Interface.

# Presentation (continued), product selection

# Modicon<sup>®</sup> Premium<sup>™</sup> automation platform

Transparent Ready<sup>®</sup>, system approach FactoryCast<sup>™</sup> Web servers and gateways

#### Presentation of the Web services (continued) FactoryCast<sup>™</sup> configurable Web services

The configurable Web services are integrated in the following Schneider Electric Ethernet products: FactoryCast<sup>™</sup> PLC modules (TSX Micro<sup>™</sup>, Premium<sup>™</sup> and Quantum<sup>™</sup>) and FactoryCast Gateway modules.

In addition to the standard Web services, the configurable Web servers offer the following functions:

- Graphic application diagnostics (customized graphic views created by the user).
   Graphic monitoring via animated Web pages created by the user and stored in the
- Web server module. And depending on the products:
- Management of PLC system and application alarms with partial or total
   Advantagement (ready to use Alarm Viewer function pages)
- acknowledgement (ready-to-use Alarm Viewer function pages). Open data server interface. SOAP/XML protocol, WSDL interface (1).

FactoryCast Web servers can also be used to customize the supervision, diagnostics or maintenance interface via user-defined Web pages or any other document (doc, pdf, etc.) hosted in the module.

#### FactoryCast<sup>™</sup> HMI active Web services

The active Web services are integrated in the Premium and Quantum FactoryCast HMI PLC modules.

In addition to the FactoryCast Web services, the FactoryCast HMI modules provide HMI functions, which are executed in the module itself:

- Real-time HMI database management, independent of the PLC processor
- Arithmetic and logical calculations based on HMI data
- Direct connectivity with relational databases (traceability)
- Data Logging: recording of data in the module
- Display of Unity Pro graphic runtime screens in the form of Web pages
- Recipe management (read/write)
- Alarm and report notification by e-mail
- Active page server, dynamic generation of animated HTML pages
- Dynamic generation of HTML reports
- Open data server interface SOAP/XML WSDL interface protocol (1).

FactoryCast HMI is defined as an active Web server used to execute HMI functions without any effect on the PLC application program and therefore on its scan time.

(1) Standard protocol providing interoperability with computer management applications (see pages 5/26).

### **Functions**

# Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Transparent Ready<sup>®</sup>, system approach

Modicon PLC standard Web services

### **Modicon® PLC standard Web services**

The predefined "Rack Viewer" PLC diagnostic function and the "Data editor" read/ write function are supported by all Ethernet Modbus®/TCP modules (1) in the following Modicon® automation platforms:

- Premium<sup>™</sup>
- Quantum<sup>™</sup>
- M340<sup>™</sup>
- Momentum<sup>™</sup>
- TSX Micro<sup>™</sup>

See the selection of Web server products on page 5/15.

These functions can be accessed using a standard Internet browser connected to the network. They are "ready to use" and secure (password-protected).

They can be used locally or remotely via:

- Intranet
- Modem and RAS server
- Internet

(1) For standard Web servers integrated in variable speed drives, please consult our catalog "Soft starters and variable speed drives".

### Functions (continued)

# Modicon<sup>®</sup> Premium<sup>™</sup> automation platform

Transparent Ready<sup>®</sup>, system approach Modicon PLC standard Web services

#### Modicon® PLC standard Web services (continued)

#### "Rack Viewer" PLC diagnostics function

The "Rack Viewer" function (PLC rack display) can be used for PLC system and I/O diagnostics. It displays the following in real time:

- LED status on the front panel of the PLC
- The PLC type and version
- The hardware configuration of the PLC including the status of the system bits
- and words
- Detailed diagnostics of each I/O module channel or application-specific channel in the configuration

Data editor variables table

#### "Data Editor" read/write function for PLC data and variables

The "Data Editor" function can be used to create tables of animated variables for real-time read/write access to lists of PLC data.

Various animation tables, containing specific application variables to be monitored or modified, can be created by the user and saved in the standard Web server module.

	-	111	1233	
1	*	-		8 10-
	H	r	0	0
0	1	s	10	

- In addition to the functions provided by standard Web servers, FactoryCast<sup>™</sup> Web servers offer the following: ■ Variables to be displayed can be entered and displayed using their symbol (S\_Pump 234) or their
- address (%MW99) ■ The write access option for variables can be enabled or disabled for each of the variables using the
- FactoryCast configuration software.
- The read/write function can be used on tools such as "pocket" PC or PDA terminal.

Cast

# Modicon<sup>®</sup> Premium<sup>™</sup> automation platform

Transparent Ready<sup>®</sup>, system approach Modicon PLC standard Web services

### FactoryCast<sup>™</sup> configurable Web server

In addition to standard Web services, FactoryCast modules (see selection table on page 5/15) support the following functions:

- Alarm Viewer
- Creation and display of graphic views via an online graphics editor (Graphic Data Editor, supplied)
- Hosting and display of Web pages created by the user
- SOAP/XML server interface

# 

#### Alarm viewer function

The alarm viewer is a "ready to use", password-protected function. This function can be used to process alarms (display, acknowledgment and deletion) managed at PLC level by the system or using diagnostic function blocks known as DFBs (system-specific diagnostic function blocks and application-specific diagnostic function blocks created by the user).

These alarms are stored in the PLC diagnostic buffer (specific memoryarea used to store diagnostic events). This function is available with the Premium<sup>™</sup> platform (with PL7<sup>™</sup> or Unity<sup>™</sup> software) and the Quantum platform (with Unity software).The diagnostics viewer consists of a Web page displaying a list of messages with the following information for each alarm:

- Dates and times of the appearance/disappearance of the detected fault
- Alarm message
- Alarm status
- Type of associated diagnostic function block (DFB)

### Functions (continued)

# Modicon<sup>®</sup> Premium<sup>™</sup> automation platform

Transparent Ready<sup>®</sup>, system approach Modicon PLC standard Web services

### FactoryCast<sup>™</sup> configurable Web server (continued)

#### User Web page hosting and display function

FactoryCast Web modules have an 8 Mbyte memory (1) which is accessed in the same way as a hard drive and can be used to host Web pages and user-defined documents in Word or Acrobat Reader (for example, maintenance manuals, diagrams, etc.).

These Web pages can be created using any standard tool for creation and editing in HTML format. These pages can be enhanced by inserting animated graphic objects linked to PLC variables. These animated objects are created using the Graphic Data Editor supplied with FactoryCast.

The Web pages created can be used, for example, to:

- Display and modify PLC variables in real time
- Create hyperlinks to other external Web servers (documentation, suppliers, etc)

This function is particularly suitable for creating graphic interfaces used for the following purposes:

- Real-time display and supervision
- Production monitoring
- Diagnostics and help with maintenance
- Operator guides

#### SOAP/XML server interface

FactoryCast modules incorporate a standard SOAP/XML data server that provides direct interoperability between automation devices and computer management applications (MES, ERP, SAP, .Net application, etc.). See page 5/26.

#### **Graphic Data Editor function**

This function can be used to create graphic views animated by PLC variables. The graphic editor is available online "ready to use", and also offline using FactoryCast configuration software.

■ These views are created by simple copy/paste operations, using a library of predefined graphic objects. The object parameters are set according to user requirements (colors, PLC variables, labels, etc.). List of graphic objects provided:Analog and digital indicators

- Horizontal and vertical bar charts
- Boxes for displaying messages and entering values
- Pushbutton boxes
- Functions for recording trends
- Tanks, valves, motors, etc.

Customized graphic objects can be added to this list. They can be reused in user Web pages that have been created using standard software for editing HTML pages.

The views created can be saved in the FactoryCast modules.

(1) Memory is not affected by power outages or reinitialization of the PLC

## Presentation

# Modicon<sup>®</sup> Premium<sup>™</sup> automation platform

Transparent Ready<sup>®</sup>, system approach FactoryCast<sup>™</sup> HMI active Web services

### FactoryCast<sup>™</sup> HMI active Web servers

FactoryCast HMI Web services are integrated in the Web server modules embedded in the Modicon® Premium<sup>™</sup> and Quantum<sup>™</sup> automation platforms.

These modules have the following Ethernet and Web services:

■ Ethernet TCP/IP communication functions:

□ TCP/IP messaging service with Modbus® TCP/IP and Uni-TE<sup>™</sup> TCP/IP protocols

- SNMP agent for standardized network management supports standard MIB II
- and Transparent Ready private MIB.
- FactoryCast configurable Web services:
- "Rack Viewer" PLC diagnostics functions (see page 5/17)
- □ "Data editor" read/write functions for PLC variables(see page 5/17)
- □ "Alarm viewer" alarm display functions (see page 5/18)
- □ "Graphic Data Editor" online graphic view editor functions(see page 5/18)
- □ Function for hosting and displaying user Web pages (see page 5/19)

FactoryCast HMI modules also provide the following specialized HMI Web services: Real-time HMI database management, independent of the PLC processor

- Arithmetic and logical calculations on HMI data
- Direct connectivity with relational databases (traceability)
- Data Logging: recording of data in the module
- Display of Unity<sup>™</sup> Pro graphic runtime screens in the form of Web pages
- Recipe management (read/write)
- E-mail notification for alarms and reports
- Active page server, dynamic generation of animated HTML pages
- Dynamic generation of HTML reports
- Open data server interface. SOAP/XML WSDL interface protocol (1).

<sup>(1)</sup> In order to simplify choice and to help ensure their interoperability within a system, each Transparent Ready product is identified by the class of services it provides. Letter A, B, C or D (level of service for the Web server) followed by 10, 20 or 30 (level of service for Ethernet communication).

## Presentation (continued)

# Modicon<sup>®</sup> Premium<sup>™</sup> automation platform

Transparent Ready<sup>®</sup>, system approach FactoryCast<sup>™</sup> HMI active Web services

### Architectures

- FactoryCast<sup>™</sup> HMI Web servers can be integrated in various architectures:
- Installations that require a flexible distributed HMI solution
- Combined architectures supplementing conventional SCADA systems
- Architectures where a direct link is required between automation systems and information groups and link is required between automation systems and

information management levels (IT link).

#### Flexible distributed HMI solution

The use of Web-based technologies means that FactoryCast HMI can replace conventional HMI or SCADA solutions in applications where architectures require a flexible multistation HMI, thus providing a temporary "nomadic" remote control function.

These architectures consist of:

- Several PLCs networked on Ethernet, equipped with FactoryCast HMI Web server modules
- One or more PC terminals simply equipped with a Web browser thus providing a "Thin Client" interface (licence free).
- Optionally, a relational database where Factory Cast HMI can archive data from the automation system.

FactoryCast HMI modules read PLC data and execute HMI services (e-mail, interpreted calculations, connection to relational databases, updating Web pages) at source in the PLC, without affecting the PLC program or the scan time.

This solution provides:

- A reliable HMI application, which is executed at source in a robust PLC device
   An integrated multistation interface and remote access that is easy and cost-
- effective to set up ("Thin Client" terminal, for example Magelis<sup>®</sup> Smart). An HMI application that is easy to maintain (the application is housed in a single
- location on the server side)
- Preventive maintenance via e-mail
- Greater availability for archiving data in the PLC

## Presentation (continued)

# Modicon<sup>®</sup> Premium<sup>™</sup> automation platform

Transparent Ready<sup>®</sup>, system approach FactoryCast<sup>™</sup> HMI active Web services

### Architectures (continued)

#### Combined architectures

In this type of architecture FactoryCast<sup>™</sup> HMI supplements conventional SCADA systems, such as Vijeo<sup>®</sup> Look or Monitor Pro<sup>™</sup>, which meet the requirement for centralizing information for global supervision from a central site.

- Combining a FactoryCast HMI solution and a conventional SCADA solution enables: Simplification of the SCADA application by locating some of the SCADA
- processing functions at source, at PLC level ■ Increased availability of the traceability function due to the direct connection between FactoryCast HMI modules and relational databases
- Powerful "ready to use" remote diagnostics capacities

 "Nomadic" client stations to be connected to the Intranet or Internet via "Thin Client" PC or PDA devices

#### Direct links with the information management levels

In this type of architecture FactoryCast HMI eliminates the need for intermediate devices (software or hardware gateways), which are expensive to install and maintain, by establishing direct links between the automation levels and the global information management levels (MES, ERP, etc.).

The PLC manages the following links which allow a "collaborative" automation system to be set up, making it easier to share data in real time:

- Directly archives information from the automation system in relational databases
- Directly interacts with IT applications via the SOAP/XML client/server interface

#### This solution results in:

- Simplified architectures
- Lower installation, development and maintenance costs
- Increased reliability of information (the data is collected at source)
- Increased interoperability with IT applications
- Greater availability of data archiving

## Functions

# Modicon<sup>®</sup> Premium<sup>™</sup> automation platform

Transparent Ready<sup>®</sup>, system approach FactoryCast<sup>™</sup> HMI active Web services

### **Specialized HMI services**

#### Real-time database

With an internal architecture similar to that of an HMI/SCADA system, FactoryCast<sup>™</sup> HMI modules manage their own variables databases in real time, independently of the PLC program. It is these variables databases that are used to execute various functions, including internal processing, archiving, alarms and e-mail, etc.

Variables in this real-time database are updated using the PLC's data acquisition service.

This service becomes operational once the following parameters have been set in the FactoryCast HMI software:

- Direct import of PLC variable/symbol databases (no double entry)
- Definition of the frequency of acquisition (period at which this variable is updated)

**Note:** A FactoryCast HMI application running in a Premium configured FactoryCast HMI module can access the PLC variables in the architecture transparently on the network (X-Way/Uni-TE<sup>™</sup> transparent protocols).

#### Characteristics

- Maximum number of I/O variables per application: 1000 variables from PLCs
- Maximum number of internal variables per application: 100
- Acquisition frequency: 500 ms minimum

#### **Calculation functions**

The FactoryCast HMI server can carry out various arithmetic or logical operations on a combination of variables from the HMI database. These calculations include, for example, scaling, formatting, logic processing for event triggering, etc.

This calculation function is operational from the local HMI database, independently of the PLC processor, and is in the form of spreadsheets where the formulas are defined in cells.

These spreadsheets are interpreted and processed by the server. The result of each formula is associated with a new internal variable. The processing of each spreadsheet is initiated by a trigger.

#### E-mail transmission

The FactoryCast HMI module can, on a specific event, send e-mails completely autonomously to a predefined list of e-mail addresses. This function is executed independently of the PLC program.

The event that triggers the e-mail may be associated with the following:

- A PLC variable (I/O, internal variable)
- An alarm, a threshold overshoot
- A machine or process state
- An operator action, etc.

When an e-mail is sent it passes via an SMTP (Simple Mail Transfer Protocol) server. This server receives the e-mail and waits for the recipient to acknowledge it. The e-mail service is compatible with SMTP servers. A return address can be defined should delivery to the destination address fail.

#### Characteristics

- Configuration of the SMTP server: compatible with SMTP servers
- Maximum number of e-mails: 100
- Contents of e-mail messages: free text with embedded dynamic variable values (from the PLC) and hyperlinks (unlimited).

E-mail transmission

### Functions (continued)

# Modicon<sup>®</sup> Premium<sup>™</sup> automation platform

Transparent Ready<sup>®</sup>, system approach FactoryCast<sup>™</sup> HMI active Web services

Connection to databases

#### Specialized HMI services (continued)

#### Connection to relational databases

The FactoryCast<sup>™</sup> HMI module can be connected directly and completely autonomously to the following remote relational databases:

- SQL Server®
- MySQL<sup>®</sup>
- Oracle<sup>®</sup>

This connection enables process or internal data to be archived directly in the FactoryCast HMI module without any intermediate system (hardware or software).

The data can be archived (written) periodically and/or on a specific event. These variables can either be from PLCs(I/O bits, internal bits, internal words and registers), or local to the module.

The FactoryCast HMI "Roll over" function checks the size of tables by managing the maximum number of records.

This circular data archiving function automatically deletes the oldest data and can be accessed by simply setting parameters in the FactoryCast HMI software.

#### Characteristics

- Number of databases that can be connected: 3.
- Number of tables that can be written per database: 10 maximum
- Number of columns per table: 50 maximum
- Type of database supported: Oracle, SQL Server and MySQL
- Automatic table creation: the FactoryCast HMI server creates a table in the database if one does not already exist

Data Logging

**Data Logging** 

FactoryCast HMI modules can record data in the internal flash memory periodically or on an event.

This record is created in a CSV file, which can be:

- Automatically exported via FTP
- Attached to an e-mail

This function is particularly useful for standalone installations, or stationsthat are not connected to an Intranet, or for local traceability of data.

5

### Functions (continued)

# Modicon<sup>®</sup> Premium<sup>™</sup> automation platform

Transparent Ready<sup>®</sup>, system approach FactoryCast<sup>™</sup> HMI active Web services

#### Specialized HMI services (continued)

#### **Recipe management**

The recipe management function enables a FactoryCast<sup>™</sup> HMI application to take recipe files into account automatically on process events or at the request of an operator, applying the recipe values to the PLC data memory.

This function provides very flexible data management in the execution of production or process changes by sending new setpoints and new parameters.

#### Characteristics

- Recipes are described using XML<sup>®</sup> format (SOAP/XML format)
- Recipes are stored in the module or remotely
- Recipes contain setpoint values in accordance with "standard" recipes, and these values are transferred to the PLC memory.

Recipe management

#### Web based HMI interface

The memory of the FactoryCast HMI Web server receives Web pages defined by the user to provide a graphic HMI interface. The Active Web Server provides dynamic refreshing of the Web pages generated by the server itself.

FactoryCast HMI supports two types of Web page:

HTML pages animated in real time with Java® graphic objects used to create the user interface (FactoryCast HMI comes with a complete library of Java graphic objects).

Active Web pages dynamically generated in the Web server with integration of PLC variables inside the HTML code (PLC "tags") which can be used to generate reports. These active pages consisting of HTML code are fully compatible with all "Thin Client" terminals (pocket PC, PDA, or PC terminal).

#### SOAP/XML client/server interface

For total interoperability, FactoryCast HMI implements SOAP/XML Web service: server function capable of answering SOAP requests generated by any client application (MES, ERP, SAP, SCADA or third-party applications developed in .NET<sup>®</sup> or Java).

See page 5/26.

SOAP/XML client/server interface

Ethernet, Transparent Ready® SOAP/XML Web service

#### **Presentation**, functions

The standardization of Web services has come about as a result of joint development between Microsoft® and IBM®, amongst others, validated at the W3C® (World Wide Web Consortium) as an open "standard".

It now provides the tools, specifications and environments needed for each platform. Web services are based on standards such as:

- XML (eXtensible Markup Language): the universal standard for data exchange
- SOAP (Single Object Access Protocol) protocol carried via the HTTP (Hyper Text Transfer Protocol) channel.

■ WSDL (Web Services Description Language) the Web Services description language, in XML format.

SOAP is currently considered to be the reference protocol, including in industry. It has since been adopted by the main players such as Microsoft® (•NET®, SQL Server®, Office®, etc), IBM® (Java®, WebSphere®, Lotus®), ORACLE®, Sub, SAP®, .

#### Embedded SOAP/XML Web Services: Modbus®XMLDa Web services

This new Transparent Ready<sup>®</sup> service offers the previously unused (or uncommon) possibility of making an IT/e-business application interact directly with the control system levels using the same standards.

With the implementation of Modbus® XMLDa (Modbus XML Data access) Web services in FactoryCast Web servers, the IT engineer can easily create his own application which will access the desired information directly in the PLC and in real time

Data exchanges are made in XML standard format in response to a request using SOAP protocol.

The implementation of Web services in control system equipment makes it easy to achieve vertical integration of the control level and the creation of even more collaborative architectures which can be used to link production systems to the corporate management systems. It brings simplified access to information, a reduction in the costs of training, development and deployments costs, plus an increase in productivity.

#### ModbusXMLDa Web services in FactoryCast<sup>™</sup> modules ModbusXMLDa server interface

This implementation enables a SOAP client application (management level computer application, MES, ERP, etc) to communicate directly with a FactoryCast Web server module embedded in the PLC.

Exchanges are initiated by the SOAP client application (the server responds to these requests).

Step 1: Creation of the client application with learning of the Web services. The development environment (for example, Visual Studio® •NET) looks in the FactoryCast server for the list of available services and their WSDL standard interfaces provided by the module.

Step 2: Development of the client application. The developer integrates the Web service functions using the code retrieved at the learning stage.

Step 3: Execution of the client application. The client application communicates in real time with the FactoryCast Web server module using the SOAP protocol.

#### ModbusXMLDa client interface

This implementation allows a FactoryCast<sup>™</sup> HMI module to execute a SOAP client application in order to communicate with a remote SOAP server application (for example another FactoryCast Web server module or a computer management application, MES, ERP, etc).

Exchanges are initiated by the FactoryCast HMI client module (the remote application server responds to SOAP requests sent by the FactoryCast HMI module). Step 1: Configuration of ModbusXMLDa client service. The user declares the PLC variables that are to be exchanged (in read or write mode), using the FactoryCast HMI configuration software.

Step 2: Use of the application. ModbusXMLDa client service executed in the FactoryCast HMI module communicates directly with the remote server application using SOAP requests in XML format.

ModbusXMLDa functions are implemented on the following FactoryCast modules: - Server interface : Modicon M340: BMX NOE 0110, Premium: TSX ETY 5103/WMY 100 and Quantum: 140 NOE 771 11/NWM 100 00,

Client interface: Premium: TSX WMY 100 and Quantum: 140 NWM 100 00

Transparent Ready®

Ethernet Modbus<sup>®</sup>/TCP communication service

### **Presentation**

Transparent Ready® products allow transparent communication on a single Ethernet Modbus®/TCP network.

In addition to universal Ethernet services (HTTP, BOOTP/DHCP, FTP, etc), the Transparent Ready device communication services designed for use in automation applications include:

- Modbus/TCP messaging for class 10, 20 or 30 devices.
- I/O Scanning service for class 30 devices.
- FDR (Faulty Device Replacement) for class 10, 20 or 30 devices.
- SNMP (Simple Network Management Protocol) network administration for class 20 or 30 devices.
- Global Data, for class 30 devices.
- Module Bandwidth Monitoring for class 30 devices
- NTP (Network Time Protocol) time synchronization for class 30 devices. E-mail notification of application events via SMTP for class 30 devices.
- TCP Open, optional, for class 30 devices.

Note : For details of supported services, see pages of characteristics for each product.

The following pages present the various options provided by these services in order to facilitate the optimum choice of solutions when defining a system integrating Transparent Ready devices.

Transparent Ready<sup>®</sup> Ethernet Modbus<sup>®</sup>/TCP communication service

#### Functions (continued)

Standard Ethernet services

HTTP "Hypertext Transfer Protocol" (RFC1945)

The HTTP protocol "Hypertext Transfer Protocol" is used for transmitting Web pages between a server and a browser. HTTP has been used on the Web since 1990. Web servers embedded into Transparent Ready® devices are used to provide easy access to devices anywhere in the world from a standard browser such as Internet Explorer® or Netscape Navigator®.

#### BOOTP/DHCP (RFC1531)

BOOTP/DHCP is used to automatically provide the devices with the IP parameters. This avoids having to manage the addresses of each device individually. Management is instead performed in a dedicated IP address server. DHCP protocol (Dynamic Host Configuration Protocol) is used to automatically assign the devices their configuration parameters. DHCP is an extension of BOOTP. DHCP protocol is made up of 2 components:

One for providing the IP network address,

• One for providing the IP parameters specific to the device from a DHCP server.

Schneider Electric devices can be:

BOOTP clients allowing automatic recovery of an IP address from a server,
 BOOTP servers enabling a device to distribute IP addresses to the network stations.
 Schneider Electric uses standard BOOTP/DHCP protocols for its Faulty Device Replacement service (FDR).

#### FTP "File Transfer Protocol" (RFCs 959, 2228, and 2640)

File Transfer Protocol (FTP) provides basic file sharing elements. Many systems use FTP protocol to exchange files between devices.

#### TFTP "Trivial File Transfer Protocol" (firmware updates of networking devices)

Trivial File Transfer Protocol (TFTP) is a network transfer protocol that facilitates connection to a device, and the downloading of code to this device. For example, it can be used to shove boot code onto a disk-less workstation, or connect and download firmware updates to networking devices

**Note:** Transparent Ready devices implement FTP and TFTP for transferring certain data to or from devices, in particular when downloading firmware or user Web pages.

#### NTP "Network Time Protocol" (RFC 1305)

NTP (Network Time Protocol) is used to synchronize the time of a client or server device from a time server. Depending on the network used, it provides the following time precisions based on the UTC:

Several ms on a local area network (LAN).

Several tens of ms on a wide area network (WAN).

#### SMTP "Simple Mail Transfer Protocol" (RFC 0821)

SMTP (Simple Mail Transfer Protocol) is an E-mail transmission service. It is used to send E-mail between a sender and a recipient via an SMTP E-mail server.

#### SNMP "Simple Network Management Protocol" (RFCs 1155, 1156 and 1157)

The Internet community developed standard SNMP for managing the different components of a network through a single system. The network management system can exchange data with SNMP agent devices. This function enables the manager to view the status of the network and devices, modify their configuration and feed back alarms in the event of a communication failure.

**Note:** Transparent Ready devices are SNMP-compatible and can be integrated naturally in a network managed via SNMP.

#### COM/DCOM "Distributed Component Object Model"

COM/DCOM (Distributed Component Object Model) or OLE (Object Linking and Embedding) is the name of the technology used in Windows components. This enables Windows applications to communicate transparently.

Note: These technologies are used in the OFS Data server software.

### Functions (continued)

#### Modbus® communication standard

Modbus®, the industrial communication standard since 1979, has been combined with Ethernet, which supports the Internet revolution, to make Modbus/TCP, a completely open Ethernet protocol. The development of a connection to Modbus/TCP requires no proprietary component or license purchase. This protocol may be easily combined with any device supporting a standard TCP/IP communication stack. Specifications can be obtained free of charge from the website: <u>www.modbus-ida.org</u>

#### Modbus/TCP, simple and open

The Modbus application layer is very simple and universally recognized with its 9 millions installed nodes . Thousands of manufacturers are already implementing this protocol. Many have already developed a Modbus/TCP connection and many products are currently available.

The simplicity of Modbus/TCP enables any small field team, such as an I/O module, to communicate over Ethernet without the need for a powerful micro-processor or a lot of internal memory.

#### Modbus/TCP, high-performance

Because of the simplicity of its protocol and the high speed of 100 Mbits/s Ethernet, Modbus/TCP delivers excellent performance. This means it is possible to use this type of network in real-time applications such as I/O Scanning.

#### Modbus/TCP, one standard

An identical application protocol is used for Modbus<sup>®</sup> serial link, Modbus Plus<sup>™</sup> or Modbus/TCP. This therefore makes it possible to route messages from a network to another without changing protocol.

As Modbus is implemented above the TCP/IP layer, users can also benefit from the IP routing that helps to enable devices located anywhere in the world to communicate without having to worry about the distance between them. Schneider Electric offers an entire range of gateways for interconnecting a Modbus/TCP network to already existing Modbus Plus or Modbus serial link networks.

The IANA institute (Internet Assigned Numbers Authority) has assigned Schneider Electric port TCP 502, which is reserved for the Modbus protocol. So, it is a standard within the Internet community.

A study by ARC Advisory Group, the leading analyst firm covering automation and enterprise software, shows Modbus/TCP as the World's leading industrial Ethernet protocol, in terms of units shipped in 2004.

Modbus and Modbus/TCP are recognized by IEC 61158 international standard as a fieldbus. They are also "Chinese National Standard" managed by ITEI.

#### CANopen interfacing Modbus/TCP

CiA DSP 309-2 provides a standardized mapping of CANopen data for transport on Modbus/TCP networks. In the specification Modbus function code 43/13 is reserved for this purpose. The reservation of this function code is exclusively for CANopen

#### Modbus/TCP characteristics

- Maximum size of data:
- Read: 125 words or registers.
   Write: 100 words or registers.

Transparent Ready<sup>®</sup> Ethernet Modbus<sup>®</sup>/TCP communication service

The I/O Scanning service can be used to manage the exchange of distributed I/Os on the Ethernet network after a simple configuration operation, with no need for special programming.

The I/Os are scanned transparently by means of read/write requests according to the Modbus $^{\circ}$  Master/Slave protocol on the TCP/IP profile.

This principle of scanning via a standard protocol enables communication with any device which supports a Modbus/TCP messaging in server mode.

- This service can be used to define:
- An %MW word zone reserved for reading inputs
   An %MW word zone reserved for writing outputs
- All /////// word zone reserved for writing output
- Refresh periods independent of the PLC scan.
- During operation, the module:
- Manages the TCP/IP connections with each of the distributed devices
- Scans the devices and copies the I/Os into the configured %MW word zone
   Feedback status words so that correct operation of the service can be monitored from the PLC application

■ Applies the preconfigured fallback values in the event of a communication problem.

An offer of hardware and software products that help to enable the I/O Scanning protocol to be implemented on any type of product connected to the Ethernet network. Please consult: <u>www.modbus-ida.org</u>.

#### Characteristics

- Each station can exchange, with Unity<sup>™</sup> software a maximum of:
- □ 100 words for writing
- □ 125 words for reading.
- Maximum size in the PLC managing the service:
- □ 2 K words %MW (1) in inputs and 2 K words %MW (1) in outputs with manager PLC (64 stations max.)
- □ 4 K words %MW (1) in inputs and 4 K words %MW (1) in outputs with manager PLC (128 stations max.).

#### I/O Scanning service diagnostics

I/O Scanning service diagnostics can be performed in 5 ways:

- By the application program from a data field specific to the PLC
- From the debugging screen in the programming software

### Functions (continued)

#### FDR (Faulty Device Replacement), replacement service for inoperative devices

The Faulty Device Replacement service uses the standard BOOTP/DHCP, file management and TFTP (*Trivial File Transfer Protocol*) technologies with the objective of simplifying Ethernet device maintenance.

It enables an inoperative device to be replaced by a new product while helping to ensure its detection, reconfiguration, and automatic restart by the system, without difficult manual intervention.

The principal steps are:

- **1** A device using the FDR service is inoperative.
- 2 Another similar device is taken from the maintenance pool, preconfigured with the "Device\_name" (or identifier) of the device that is out of service, then reinstalled on the network. The identifier is set by the position of the rotary switches, as for Advantys<sup>™</sup> STB a or Advantys<sup>™</sup> OTB distributed I/O. The "Device\_name" should be given with a keypad, for Altivar variable speed drives.
- 3 The FDR server detects the new addition, configures that device's IP address and transfers the configuration parameters to it.
- 4 The substituted device verifies if the parameters are indeed compatible with its own characteristics, then switches to operating mode.

The FDR server can be Modicon®:

- □ Premium<sup>™</sup> Ethernet module TSX<sup>™</sup> ETY 4103/5103,
- □ Premium<sup>™</sup> processor with integrated Ethernet port **TSX<sup>™</sup> P57 ●●●●M**,
- □ Quantum<sup>™</sup> Ethernet module 140 NOE 771 01/771 11,
- □ Quantum<sup>™</sup> processor with integrated Ethernet port 140 CPU 651 50/60,
- □ M340<sup>™</sup> Ethernet module BMX NOE 0100/0110.

Transparent Ready<sup>®</sup> Ethernet Modbus<sup>®</sup>/TCP communication service

The Global Data service helps to ensure data exchanges in real-time between stations belonging to the same distribution group. It is used to synchronize remote applications, or share a common database among several distributed applications. The exchanges are based on a standard producer/consumer protocol that helps to ensure optimal performance while maintaining a minimum network load. This RTPS (Real-Time Publisher Subscriber) protocol is promoted by the Modbus-IDA organization, and has already been adopted as a standard by several manufacturers.

#### Characteristics

A maximum of 64 stations can participate in Global Data within the same distribution group. Each station can:

- Publish one 1024-byte variable. The publication period can be configured from 1 to n periods of the Mast task of the processor.
- Subscribe to between 1 and 64 variables. Validity for each variable is controlled by Health Status Bits, linked to a refresh timeout configurable between 50 ms and 1 s. Access to a variable element is not possible. The total size of the subscribed variables reaches 4 K contiguous bytes.

In order to optimize Ethernet network performance further still, Global Data can be configured with the "multicast filtering" option, which together with switches in the ConneXium<sup>™</sup> range (see pages 5/50 to 5/52), perform data broadcasting only on Ethernet ports, where there is a Global Data service subscriber station. If these switches are not used, Global Data is transmitted in "multicast" on all switch ports.

#### **Global Data service diagnostics**

The diagnostics screens use a color code to show Global Data status:

- Configured/not configured/inoperative
- Published/subscribed.
- Global Data service diagnostics can be performed in 5 ways:
- By the application program from a data field specific to the PLC
- From the debugging screen in the programming software
- From the PLC system diagnostics function viewed with the Internet browser on a PC station
- From the ConneXview<sup>™</sup> diagnostic software **TSC EAZ 01P SFE10**
- From the standard SNMP manager software.

NTP time synchronization service Presentation

The time synchronization service is based on the NTP (*Network Time Protocol*) which is used to synchronize the time of a client or a server on Ethernet Modbus®/TCP from a server or another reference time source (radio, satellite, etc).

#### Operation

Some Ethernet communication modules for automation platforms: □ 140 NOE 771 11 with the Modicon<sup>®</sup> Quantum<sup>™</sup> Unity<sup>™</sup> ≥ V2.0, □ TSX<sup>™</sup> ETY 5103 with Modicon<sup>®</sup> Premium<sup>™</sup> Unity<sup>™</sup> ≥ V2, have an NTP client component.

These modules can connect to an NTP server using a client request (unicast), in order to update their local time. The module clock is updated periodically (1 to 120 s) with a tolerance < 10 ms for processors, < 5 ms for high performance processors. If the NTP server cannot be reached, the Ethernet Modbus/TCP module switches to a standby NTP server.

Ethernet module associated	with its Unity processor	Predicted typical time service	e prec	ision		
Ethernet modules	Unity processors	Clock synchronization (1)		Event synchronization	Time stamping (2)	
TSX <sup>™</sup> ETY 5103	TSX <sup>™</sup> P57 0244M TSX P57 1●4M TSX P57 2●4M TSX P57 3●4M	± 1 ms typical ± 10 ms max.	= Clock synchronization precision		= Clock synchronization precision	
	TSX P57 4•4M TSX P57 5•4M TSX P57 664M	± 1 ms typical ± 5 ms max.		+	+

	140 CPU 651 50 140 CPU 651 60 140 CPU 671 60	± 1 ms typical ± 5 ms max.		I/O time		

(1) Time difference between field input and central NTP server.

(2) Assuming input connected to the interrupt module.

The PLC processor clock is therefore itself updated with a precision of 5 ms for processors, 1 ms for high performance processors. A function block is available for reading this clock. In each PLC application, events or variables can be time-stamped.

The Ethernet module is configured via a Web page. The time zone can be configured. A time synchronization service (NTP) diagnostic Web page is also available.

Information on the time synchronization service (NTP) is also available in the Transparent Ready private MIB, which can be accessed via the SNMP network management service (see above).

Transparent Ready<sup>®</sup> Ethernet Modbus<sup>®</sup>/TCP communication service

#### Functions (continued)

### SMTP electronic mail notification service

This simple mail notification service is a programmed service that allows PLC applications to report by exception conditions monitored by the PLC. The automation controller can automatically and dynamically create E-mail to alert specified users with data, alarms and events - whether the recipients are local or remote.

Note: This service is available on the latest version of Premium<sup>™</sup>/Quantum<sup>™</sup> Ethernet modules & CPUs, when operating with Unity<sup>™</sup> Pro software. A more comprehensive E-mail service, independent of the PLC application, is available on the FactoryCast<sup>™</sup> HMI modules with the active Web server, see page 5/23

#### Usage

A simple yet powerful mechanism is used. Predefined mail headers are linked together with the body of the E-mail which is created dynamically from the latest information in the automation application.

The user logic program can trigger the message based on a predefined event or condition. Using a function block, one of 3 predefined headers is selected and an E-mail message with variable information and text (up to a maximum of 240 bytes) is created and sent directly from the PLC.

Each of the three mail headers contains these common predefined items E-mail recipient list, sender name and subject. This information can be defined and updated by an authorized administrator using the configuration web pages.

#### Message creation and delivery

The PLC application selects the appropriate header. The system architect may define the mail headers to indicate differing importance levels. For example :

- Header 1 could be "URGENT problem reported by PLC 10",
- Header 2 might be "WARNING at substation 10",
- Header 3 could be "INFO message from water system".

Differing lists of recipients between the three headers help to ensure that the right information quickly flows to the right recipients. The application can then add pertinent information to the body of the E-mail message such as the specific device, process or location.

Completed E-mail is then sent to an electronic mail server for expeditious distribution to the interested parties. These recipients could be engineers, managers, process owners etc.

#### Security

Each E-mail message can be protected by an optional login and password that is authenticated by the SMTP mail server. If, for additional security, the site's mail installation has changed the TCP port number from the default of 25, the port number can be changed in the PLC E-mail configuration (via secured web page access).

#### Configuration

An authorized administrator can use a web page to easily configure the E-mail service. For each of the three mail headers, the sender; recipient list and subject message can be defined. The E- mail server connection information such as IP address and security information can also be set from the web page.

#### Diagnostics

Similar to other Ethernet services in Modicon<sup>®</sup> Premium<sup>™</sup> and Quantum<sup>™</sup> systems, the E-mail service has a Diagnostic Web page showing the current system status.

#### **Remote Monitoring**

These products provide diagnostic information for remote management applications following the SNMP network management standard. Information for the E-mail service is included in the Schneider Electric private MIB which is publicly available.

Transparent Ready®

Ethernet Modbus®/TCP communication service

### Functions (continued)

#### SNMP service protocol

The SNMP (Simple Network Management Protocol) protocol is used, from a network management station, to monitor and control all Ethernet architecture components and to help ensure rapid diagnostics if a problem occurs. It is used to:

Query devices such as computer stations, routers, switches, bridges or terminal devices (DTE) in order to view their status

Obtain statistics for the network on which the devices are connected.

This management software respects the traditional Client/Server model. However, in order to avoid confusion with other communication protocols using this terminology, we prefer to use these definitions:

■ ConneXview<sup>™</sup> network diagnostic software TSC EAZ 01P SFE10

Network manager for the Client application running on the computer station

SNMP agent for the server application that runs on the device.

Transparent Ready<sup>®</sup> can be managed by any SNMP network manager, including HP Openview<sup>®</sup> or IBM Netview<sup>®</sup>.

Standard SNMP (Simple Network Management Protocol) is used to access configuration and management objects included in the MIB (Management Information Base) for the devices. These MIBs must comply with certain standards in order to be accessed by available management services. However, depending on the device complexity, manufacturers can add certain objects to the private databases.

The Transparent Ready private MIB includes management objects specific to the Schneider Electric offer. These objects simplify installation, implementation, and maintenance for Transparent Ready products in an open environment using standard network management tools.

The Transparent Ready products support 2 SNMP network management levels: ■ Standard MIB II, a first level of network management, can be accessed via this interface. It lets the manager identify the devices forming the architecture and retrieve general information on the configuration and operation of the Ethernet TCP/IP interfaces

MIB Transparent Ready interface; management of the Transparent Ready devices is improved via this interface. This MIB includes a set of data that enables the network management system to supervise the Transparent Ready services. The Transparent Ready private MIB can be downloaded from the Web server from any Ethernet Transparent Ready module in a PLC.

Automatic recognition of IP devices via the ConneXview diagnostic software for Ethernet industrial networks

Transparent Ready<sup>®</sup> Ethernet Modbus<sup>®</sup>/TCP communication service

### TCP Open<sup>™</sup> optional service Presentation

**TSX<sup>™</sup> ETY 110 WS/5103** Premium<sup>™</sup> platform Ethernet modules support a number of communication protocols based on the TCP/IP standard.

Among these, the Modbus<sup>®</sup> protocol has public specifications and its simplicity recommends it for the needs of communication with third-party devices.

However, for certain applications, it may prove necessary to use other protocols. This is the case when, for example, users wish to integrate Modicon<sup>®</sup> Premium<sup>™</sup> platforms into existing architectures which use a particular communication protocol, possibly a proprietary one.

To meet these needs for open access, 2 interface levels are included in the Schneider Electric offer:

■ A library of basic functions, which can be used in C language, helps to enable direct access to the socket interface on TCP. The user can create his own communication functions using SDKC development software and take advantage of the ease of use this program offers in terms of development and debugging. Once generated, these function blocks are used in the application like any standard PL7<sup>™</sup> or Unity<sup>™</sup> Pro programming software function block

■ A library of basic function blocks known as EFs can be used directly in the application programs with the PL7 or Unity Pro languages. These are the same as functions developed in C language seen earlier, but are designed for use by non-computer specialists. These EF function blocks are not modifiable.

#### Functions

Operating in TCP connection client/server mode, the basic functions on the Berkeley socket interface enable:

- Management of 16 connections on the Open profile out of a maximum of 32
- Creation of sockets and their attachment to any TCP port
- Switching of these sockets to "listen for a connection request from a remote client"
- mode
- Opening of a connection
- Transmission and reception of data on these connections (8 bytes max.)
- Closing this connection.

Transparent Ready<sup>®</sup> Ethernet Modbus<sup>®</sup>/TCP communication service

### TCP Open<sup>™</sup> optional service (continued)

### Description

The TCP Open<sup>™</sup> offer consists of a CD-ROM containing the TCP/IP function libraries. Open access on TCP is only possible via **TSX<sup>™</sup> ETY 110WS** (1) and **TSX ETY 5103** *Ethernet modules*. With open access on TCP, the basic functions of these modules can be used.

#### The TCP/IP TLX CD TCP 50M function library is comprised of:

The SDKC program enhancement library that provides access to the module TCP/IP socket functions

■ The user's manual in English (electronic copy only)

■ EF elementary communication function blocks (Socket/Bind/Listen/Accept/ Shutdown/Close/Send/Receive/Select/Set\_Socket Option/Connect) for installation using PL7<sup>™</sup> software (version ≥ V3.3)

Higher level EF function blocks, provided by way of example, which can perform more advanced functions such as the complete sequence for establishing or closing a connection, or sending or receiving data. The source files for these EF blocks are also supplied

■ An example of a PL7 application communicating with a TELNET application on a PC.

If customized function blocks are needed both:

- the SDKC program for C language:
- □ UNY SPU ZU CD 20E (with Unity<sup>™</sup> Pro software)
- □ or TLX L SDKC PL741M (with PL7 software)
- and the library of function blocks TCP Open TLX CD TCP50M
- should be installed on the development station.

#### Setup precautions

The development of C language functions requires compliance with certain setup precautions:

To set up these services, the user should be familiar with the TCP/IP profile
 In addition, since the SDKC program enables access to all the PLC internal resources, the necessary precautions should be taken when developing EF communication blocks to avoid endangering the PL7 application, especially on the

commonly fragile operating modes such as cold/warm restarts, response to a fault, etc ■ The user should also take care to maintain the requests from the different communication profiles at a level compatible with the performance required by the application

■ Finally, it is the responsibility of the client application software (PL7, Unity Pro or C program) to manage the operating modes for communications that may be specific to the application. For example, how should the application behave if a remote device does not respond, or if there is a break in the connection?

For these different reasons, we recommend that you consult your Schneider Electric Regional Sales Office to help ensure that your TCP protocol open access project is feasible.

(1) Open access on TCP requires TSX ETY 110 WS modules, version ≥ PV 03 and SV 2.9. In addition, it should be integrated on a configuration with a TSX P57 ●•3/●•4 processor (or TSX P57 ●•2 version > V3.3).

Performance

### Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Ethernet Modbus<sup>®</sup>/TCP network

#### Selecting the communication architecture

When choosing an architecture, it is advisable to take account of the required performance as early as possible. To do this, the developer must:

- 1 Know exactly what he needs:
- $\hfill\square$  quantity and type of devices to be connected to one another
- volume and type of exchanges
- $\hfill\square$  expected response times
- environment

2 Compare his needs with the characteristics of the available offers, being aware that the actual performance level between any 2 points in an architecture is dependent on the weakest link in the chain, which may:

depend on the hardware

□ but also depends on the applications (size, architecture, operating system, machine power rating, etc) which are often only vaguely defined at this stage of the project.

3 Determine which is the most suitable architecture.

The purpose of the next few pages is to provide the main information and instructions needed to answer the second point. Given that the performance of an Ethernet architecture is linked to several parameters, these pages do not supply all the information needed to calculate the network performance. Their aim is to focus on the following main aspects:

■ Instructions for calculating the network load so as to design an Ethernet network that meets the demands of the applications.

■ Application response time to be obtained depending on the configuration used, see page 9/39 of this catalog.

■ Processing capacities of Modicon<sup>®</sup> M340<sup>™</sup>, Modicon<sup>®</sup> Premium<sup>™</sup> and Modicon<sup>®</sup> Quantum<sup>™</sup> platforms used to select the processor and define the number of Ethernet connections required on the PLC depending on the application. Please see pages 5/42 and 5/43.

### Calculating the network load

### Introduction

When calculating the load on an Ethernet network, the communication services of the peripheral devices connected to the network need to be calculated. Because of the outstanding performance of the Ethernet network, the load is often less than the limits of the Ethernet network and does not greatly affect the application response time. This phenomenon is explained by the high speed of the Ethernet network: the network transaction time is 10% less than the application response time. In order to help ensure a low network load and avoid large theoretical calculations, it is highly advisable to separate the collision domain so as to limit the network load, using only the switched network (tree, star or daisy-chain topology).

Event Report TT Station 1 CT1 CT1 CT1 CT1 NAT Station 2 Action

### **Application response time**

#### Modbus<sup>®</sup> (or Uni-TE<sup>™</sup>) messaging service response time

Exchanges between the PLC processor and the Ethernet module are synchronous with the PLC scan time (CT), just like the I/O exchanges. On occurrence of the event (an input set to state 1 for example), a message can only be sent after this event has been recorded. The start of the next cycle, and execution of the PLC program (Modicon® M340<sup>™</sup>, Modicon<sup>®</sup> Premium<sup>™</sup> or Modicon<sup>®</sup> Quantum<sup>™</sup>), are on average around 1.5 cycle times after occurrence of the event.

The network access time (NAT) appearing in the table below in ms, adds together the module transit time and the waiting time before the message can be sent on the network.

Processing	Modicon <sup>®</sup> M340 <sup>™</sup>		Modicon <sup>®</sup> Premium <sup>™</sup>		Modicon <sup>®</sup> Quantum <sup>™</sup>		
Modbus <sup>®</sup> /TCP message requests	BMX NOE 0100 BMX NOE 0110	BMX P34 2020 BMX P34 2030	TSX <sup>™</sup> ETY 210 TSX ETY 110WS	TSX ETY 4103/5103 TSX <sup>™</sup> WMY 100 TSX <sup>™</sup> P57 1057 60	140 NOE 771 01/111 140 CPU 113/311 ● 140 CPU 434/534 1●	140 CPU 65 150/160 140 CPU 67 160	
Network access time NAT	< 10 ms	< 10 ms	< 25 ms	< 10 ms	< 10 ms	< 10 ms	

The transaction time TT integrates the delay between sending a message from a client station 1, its reception by the server station 2, processing the request, sending the response and it being taken into account by the station 1 (updating an output for example).

As shown in the above block diagram:

The transaction time TT should be between:

2 x CT1 + 2 x NAT < TT < 4 x CT1 + CT2 + 2 x NAT

The average duration TT<sub>av</sub> is equivalent to:

TT<sub>av</sub> = 3 x CT1 + 0.5 x CT2 + 2 x NAT

#### Global Data service response time

The transaction time TT integrates the delay between publication of a Global Data service by station 1, its reception and its processing by the remote station 2 and it being resent to the initial station 1: For an exchanged variable:

			-
If C	Γ<	5	ms,

transaction time:	TT = 5 to 6 x CT
If CT ≥ 10 ms,	
transaction time:	TT = 3 x CT

### Performance (continued)

### Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Ethernet Modbus<sup>®</sup>/TCP network

СТ Manager Elfernet Motbus/TCP RT Input Device 1 Output Device 2

#### Application response time (continued)

#### I/O Scanning service response time

The response time RT includes the time between taking a remote input into account and updating the state of a remote output. It includes the processing time in the PLC.

This response time RT consists of the following parameters:

□ TMod In and TMod Out: Response time of the read/written device, excluding the electrical transit time at the input/output (TMod depends on the device, usually between 1 and 8 ms)

□ TIOS In and TIOS Out: Time between 2 read/write operations on the same device (0.3 ms x number of scanned devices), at least equivalent to the configured scan time

As TIOS is executed in parallel with the PLC scan, it can be hidden with respect to the response time RT).

□ Cycle T: PLC scan time.

□ TNet : propagation time on the network (depends on the application, usually TNet = 0.05 ms at 10 Mbit/s and 0.005 ms at 100 Mbit/s).

The response time RT can be estimated with the following 3 formulas:

■ **RT**<sub>min</sub>, minimum response time with TIOS hidden and 1 PLC scan: RT

(TMod In + 0) x TIOS In + (Tnet + N) x cycle T + (0 x TIOS Out) + Tnet + TMod Out

■ **RT**<sub>typ.</sub>, typical response time with 0.5 TIOS hidden:

RT<sub>typ</sub> = (TMod In + 0,5) x TIOS In + (Tnet + N) x Cycle T + (0,5 x TIOS Out) + Tnet + TMod Out

RT<sub>max</sub>, maximum response time with TIOS not hidden: RT<sub>max</sub> = TMod In + TIOS In + (Tnet + N) x Cycle T + TIOS Out + Tnet + TMod Out

Application response time (continued)

#### I/O Scanning service response time (continued)

Below are the TMod In and TMod Out response times:

Type of distributed I/O	Response time	Values	Values		
		Min.	Typical	Max.	
Momentum 170 ENT 110 02	TMod In	1 ms	1 ms	1 ms	
	TMod Out	5 ms	5 ms	5 ms	
Momentum 170 ENT 110 01	TMod In	4 ms	6 ms	8 ms	
	TMod Out	4 ms	6 ms	8 ms	
Modicon STB STB NIP 2212	TMod In	2 ms	3 ms	4 ms	
	TMod Out	2 ms	3 ms	4 ms	

Below are the TIOS In/TIOS Out times measured between 2 scan cycles (Ethernet network with switches)  $_{\mbox{Time}\ (ms)}$ 

Below is the number of processor cycles N:

Type of Ethernet module or processor	No. of processor cycles N			
	Min.	Typical	Max.	
Modicon <sup>®</sup> M340 <sup>™</sup> platform with Ethernet modules: BMX NOE 0100 and BMX NOE 0110	2	2.5	3

#### **Processing capacities of Modicon® platforms**

#### **Processing capacity**

Use the table below to compare for each station, the total number of messages received on the Modbus® (or Uni-TE™) messaging service if used (value R1, R2 or Ri) with the station processor capacity.

Processing Modbus requests for each PLC scan

Modicon <sup>®</sup> Premium <sup>™</sup> and M340 <sup>™</sup>	platforms	Messages received	
Total messages received by the	TSX <sup>™</sup> 57 10	4 messages/cycle	
PLC from all the communication	BMX P34 20/TSX 57 20	8 messages/cycle	
modules (1)	TSX 57 30	12 messages/cycle	
	TSX 57 40	16 messages/cycle	
	TSX 57 50/60 (2)	16/20 messages/cycle	

Modicon <sup>®</sup> Quantum <sup>™</sup>	Limitations of port	the integrated	Limitations of communicatio	Ethernet modules	
platform	Communi- cation requests	Additional read/write 4x registers	Communi- cation requests	Additional read/write 4x registers	per PLC
140 CPU 113 (3)	-	-	1message/ cycle	4 messages/ cycle	max. 2
140 CPU 311	-	-	1message/ cycle	4 messages/ cycle	max. 2
140 CPU 434/534	-	-	4 messages/ cycle	8 messages/ cycle	max. 6
140 CPU 651	16 messages/ cycle	16 messages/ cycle	4 messages/ cycle	8 messages/ cycle	max. 6

messages/cycle: number of messages received per cycle from the PLC master task (typical cycle of 50 to 100 ms)

#### Example:

Quantum 140 CPU 434 12• processor with 4 Ethernet 140 NOE 771 •1 modules:

- 20 messages/cycle for communication request, and
- 32 messages/cycle for the read/write 4x registesrs

#### Ethernet transaction processing capacity

Compare, for each station, the total number of messages received [[values Ri, Rj] and the total number of messages sent [[values Ei, Ej] (for example, for station N) with the Ethernet transaction processing capacity indicated below. Use the elements below for the Ethernet connection per PLC, rather than the number of transactions required by the application.

Ethernet transaction	Modicon <sup>®</sup> M340 <sup>™</sup>		Modicon <sup>®</sup> Premium <sup>™</sup>			Modicon <sup>®</sup> Quantum <sup>™</sup>

(1) A temporary overload, due for example to an adjustment terminal or the temporary connection of an Internet browser, on which a few PLC scans are permitted.

- (2) Only with Unity Pro software.
- (2) Only with Onicy Pro software.
  (3) Only with Concept/ProWORX software.
  (4) BMX P34 20•0 processors having the Modbus/TCP messaging in server mode can be scanned by a product having the I/O Scanning service.
  (5) Modules TSX WMY 100 and 140 NWM 100 00 : not featuring I/O Scanning and Global Data
- services.

### Processing capacities of Modicon® platforms (continued)

Maximum number of simultaneous Modbus®/TCP connections

The maximum number of simultaneous Modbus/TCP connections depends on the platform as well as the type of connection to the Ethernet network:

- The 10/100BASE-TX port in network modules.
- The 10/100BASE-TX port integrated in processors.

Number of	Modicon <sup>®</sup> M340 <sup>™</sup>		Modicon <sup>®</sup> Premium <sup>™</sup>		Modicon <sup>®</sup> Quantum <sup>™</sup>	
simultaneous Modbus®/TCP connections	BMX NOE 0100 BMX NOE 0110	BMX P34 2020 BMX P34 2030	TSX <sup>™</sup> ETY 210 TSX ETY 110WS	TSX ETY 4103/5103 TSX <sup>™</sup> WMY 100 TSX <sup>™</sup> P57 1057 60	140 NOE 771 01/11 140 CPU 113/311 ● 140 CPU 434/534 14B	140 CPU 65 150 140 CPU 65 160
Client	16	16	32	16 <i>(1)</i>	16 <i>(1)</i>	16 <i>(1)</i>
Server	16	16		64 (1)	64 (1)	64 (1)

(1) With 64 simultaneous Modbus/TCP connections maximum (clients and servers).

#### Managing the passband of Ethernet Modbus®/TCP modules

The passband management service indicates the load level of the Ethernet network module. This allows the user to monitor any drift and anticipate any problems. The Ethernet module load is indicated in 3 ways:

Expected load in the Unity<sup>™</sup> Pro/PL7<sup>™</sup> configuration screen. 

Modbus (and Uni-TE<sup>™</sup>) messaging

I/O Scanning Global Data

Other

Actual load in the Unity Pro/PL7 diagnostics/debug screen, as well as in the diagnostics pages via the Web. It is displayed in the form of a bar chart animated in real time.

- In the SNMP interface for access by the SNMP network manager.
- The passband is indicated as a percentage for each of the following services: 50 in bardering Charles Designs 🖬 its Deter inc. an ML INCOMPANY ML Ramola

Ethernet port integrated in processor, example with the BMX P34 2020/2030 Modicon M340

or

Ethernet dedicated module, example with the BMX NOE 0100/0110 Modicon M340

# **Ethernet solutions with the Modicon platforms**

The Modicon PLC has 2 types of connection to the Ethernet network: ■ The 10/100BASE-TX port integrated in processors, which also process the application, exchanges with other modules supported by the rack and other

communication ports (CANopen bus, Modbus serial link, ...).

The 10/100BASE-TX port in the dedicated module on which, unlike the processor, the resources are allocated to Ethernet Modbus/TCP communication.

These fundamentally different hardware characteristics result in equally different capacities in terms of services and performance:

The integrated port is a low-cost way of satisfying applications that are not too demanding in terms of communication (≤ 500 useful messages/s) in environments little affected by interference.

Where there are a large number of exchanges, or networks are heavily polluted. use of a dedicated module is unavoidable.

### Product data sheet

### Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Processors with integrated Ethernet port

### Description

### TSX<sup>™</sup> P57 1634M/26ee/2823/36ee/4634/4823/5634/6634M double format

processors (1) with built-in Ethernet port include the following on the front panel: 1 A display block with 5 LEDs relating to the processor.

- A display block with b LEDs relating to the process.
   A display block relating to the built-in Ethernet port.
- 3 An 8-way female mini-DIN connector marked TER for connecting a programming or adjustment terminal.
- 4 A USB connector marked TER for connecting a programming or adjustment terminal.
- 5 An 8-way female mini-DIN connector marked AUX for connecting an RS 485 peripheral device.
- 6 A standard (RJ45) connector for 10BASE-T/100BASE-TX interface.
- 7 A slot for a PCMCIA memory extension card.
- 8 A slot for a PCMCIA communication or data storage memory extension card.
- 9 A 9-way SUB-D connector (on TSX P57 2823/4823M models) for Fipio bus manager link.

### Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Ethernet network modules

### Presentation

**TSX<sup>™</sup> ETY** ●●● modules are single format modules installed in a rack slot on Modicon<sup>®</sup> Premium<sup>™</sup> PLC stations. A configuration can take from 1 to 4 network modules, depending on the type of processor.

**TSX ETY 110 WS/4103/5103** Ethernet modules route X-Way and Uni-TE<sup>™</sup> messages transparently from a Modbus<sup>®</sup>/TCP network to an X-Way<sup>™</sup> network and vice versa.

#### **Description**

The front panel of **TSX ETY** ••• modules is comprised of:

- 1 A display block indicating the state of the module.
- 2 A standard connector for 100BASE-TX and/or /100BASE-T interface (RJ45) depending on the model.
- 3 A standard connector for 10BASE5 interface (AUI).
- 4 Four thumbwheels for defining the station number and network number.

### Modicon<sup>®</sup> Premium<sup>™</sup> automation platform EtherNet/IP<sup>™</sup> network module

EtherNet (IP

Certification logo Mark

### Presentation

**TSX<sup>™</sup> ETC 100** EtherNet/IP<sup>™</sup> network module is a single format module that is installed in a rack slot on Modicon<sup>®</sup> Premium<sup>™</sup> PLC stations.

A configuration can take from 1 to 4 network modules, depending on the type of processor or slot-PLC.

#### EtherNet/IP protocol

EtherNet/IP is the industrial Ethernet network protocol based on (*Common Industrial Protocol*)

CIP and EtherNet/IP are protocols owned and managed by the ODVA<sup>™</sup>, an independent standards organization composed of members from the world's leading automation companies.

Schneider Electric is a principal member of the ODVA organization.

Schneider Electric's increased support of ODVA gives existing Modbus®/TCP users a clear path to CIP network architectures while protecting their automation investments. Users will benefit through significantly increased interoperability between the largest installed base of industrial Ethernet networks - EtherNet/IP and Modbus/TCP - as well as between automation products from a growing number of vendors.

Combined, these benefits will reduce cost, time and risk for users deploying and maintaining their network architectures.

#### Description

- The front panel of **TSX ETC 100** module features:
- 1 A display block which indicates the module status and the transmission status of the network
- 2 A unique MAC address of the module.
- 3 Two additional status LEDs "MOD STATUS" and "NET STATUS"
- 4 A standard RJ 45 connector for 10BASE-T/100BASE-TX interface.

Schneider Gelectric

Ethernet network cabling system ConneXium<sup>™</sup> connection components

#### Shielded copper connection cables

- ConneXium<sup>™</sup> shielded connection cables are available in two versions to meet the
- various current standards and approvals:
- EIA/TIA 568 shielded twisted pair cables for C€ market

#### These cables conform to:

- □ EIA/TIA-568 standard, category CAT 5E,
- IEC 11801/EN 50173 standard, class D.
- Their fire resistance conforms to:
- □ NF C32-070# C2 classification
- □ IEC 322/1 standards
- $\hfill\square$  Low Smoke Zero Halogen (LSZH).

#### EIA/TIA 568 shielded twisted pair cables for UL market

The cable material is:

- CEC type FT-1
- □ NEC type CM.

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Ethernet network cabling system

ConneXium<sup>™</sup> transceiver

#### Presentation

The use of ConneXium<sup>™</sup> transceivers makes it possible to perform the following: Creation of linear fiber-optic bus topologies, for products with twisted pair cable

Ethernet connection.

Interfacing products with twisted pair cable Ethernet connection with a fiber-optic cable.

Transceivers are "plug and play" devices that do not need any configuration.

ConneXium transceivers provide fiber-optic connections for transmission in areas subject to interference (high levels of electromagnetic interference) and for long distance communications.

Linear topology on optical fiber

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Ethernet network cabling system ConneXium<sup>™</sup> unmanaged switches

#### **Presentation**

#### Characteristics and references: twisted pair

Ready. ent

Switches are used to increase the limits of architectures based on hubs or transceivers, by

Higher layer communication is provided between the ports, and collisions at link layer are not propagated

better allocation of the pass band due to the reduction

redundant architectures to be created on twisted pair

Switches are "plug & play" devices that do not need any configuration. They can also be managed remotely via

(filtering). They therefore improve performance by

Certain Connexium<sup>™</sup> switch models also enable

the SNMP or HTTP protocols for monitoring and

separating collision domains.

of collisions and the network load.

copper ring or fiber-optic.

diagnostics purposes.

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform

CANopen machines and installations bus

#### Presentation

Originally used in the automotive industry, CAN is increasingly used in general industry. Several fieldbuses based on CAN lower layers and components are available. The CANopen machine bus conforms to the ISO 11898 international standard, promoted by the CAN In Automation Association, which consists of both users and manufacturers. This CANopen machine bus provides excellent open access and interoperability due to its standardized devices and communication profiles.

The CANopen bus is a multimaster bus which helps to ensure reliable deterministic access to realtime data in control system devices. The CSMA/CA protocol is based on broadcast exchanges, sent cyclically or on an event, which helps to ensure optimum use of the passband. A message handling channel can also be used to define slave parameters.

The bus uses a double shielded twisted pair, on which 127 devices maximum are connected by daisy chaining. The variable data rate between 20 Kbit/s and 1 Mbit/s depends on the length of the bus (between 2500 and 20 m). Each end of the bus must be fitted with a line terminator.

The CANopen bus is a set of profiles on CAN systems, possessing the following characteristics:

- Open bus system.
- Data exchanges in real-time without overloading the protocol.
- Modular design allowing modification of size.
- Interconnection and interchangeability of devices.
- Standardized configuration of networks.
- Access to device parameters.
- Synchronization and circulation of data from cyclic and/or event-controlled
- processes (short system response time).
- Interoperability between numerous international manufacturers.

### Connectable devices, description

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform

CANopen machines and installations bus

TeSys model U

Advantys FTB

Altivar ATV 71

Lexium 05

Example of devices that can be connected onCANopen

#### **Connectable devices**

The TSX<sup>™</sup> CPP 110 module performs the role of the master on the CANopen bus. Other Schneider Electric devices (slaves) which can be connected on the bus are:

- Osicoder Ø 58 mm multi-turn absolute encoders.
- TeSys<sup>®</sup> model U starter-controllers.
- TeSys<sup>®</sup> model D using the Quickfit installation assistance system.
- Advantys<sup>™</sup> OTB, IP 20 Optimum distributed I/O
- Advantys<sup>™</sup> STB, IP 20 modular distributed I/O.
- Advantys<sup>™</sup> FTB, IP 67 monobloc I/O splitter boxes.
   Advantys<sup>™</sup> FTM, IP 67 modular I/O splitter boxes.
- Preventa<sup>™</sup> XPS MC, configurable safety controllers
- Altivar<sup>®</sup> 31, variable speed drives for asynchronous motors 0.18...15 kW.
- Altivar<sup>®</sup> 71/61, variable speed drives for asynchronous motors 0.75...630 kW.
- Lexium<sup>®</sup> 05, servo drives 0.4...6 kW for BSH servo motors.
- Lexium<sup>®</sup> 15, servo drives 0.9...42.5 kW for BDH and BSH servo motors.
- IcLA intelligent compact motor-drives from Schneider Electric.

Also compatible:

- Any third-party device which conforms to the CANopen standard profile.
- Any CAN device which uses CAN V2.0B identifiers on the ISO 11898 physical layer. The TSX CPP 110 PCMCIA card supports the V4.02 CANopen standard with in particular the heartbeat network management.

TSX CPP 110

#### Description

The Modicon® TSX Micro™ and Modicon® Premium™ platforms connect to the CANopen bus by means of the TSX CPP 110 type III PCMCIA card inserted in the processor or slot-PLC communication port slot.

The TSX CPP 110 machine bus CANopen set is comprised of:

- A PCMCIA card, type III with fixing screws.
- A tap junction equipped with one 9-way SUB-D connector for connecting the CANopen bus.
- 3 A connection cable length 0.5 m, interdependent of the PCMCIA card and the tap junction.

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform

CANopen machines and installations bus

Example of SyCon configuration devices screen

The CANopen bus is configured using dedicated SyCon (1) software, which should be ordered separately, reference SYS SPU LF• CD29M. This software is used:

To describe devices connected on the bus.

To generate the ".CO" file including the information relating to the devices

connected. This extension file is imported into the PLC application via the

PL7<sup>™</sup> Micro/Junior/Pro programming software.

If the configuration file is too large in relation to the TSX Micro<sup>™</sup>/Premium<sup>™</sup> processor capacity (see characteristics table), it is possible to load the master configuration directly by inserting the **TSX<sup>™</sup> CPP 110** card in a PCMCIA port (type III) on the PC where SyCon<sup>®</sup> software has been installed.

In PL7<sup>m</sup> or Unity<sup>m</sup> Pro software (2), it is possible to configure the CANopen bus card so that the PLC processor/**TSX CPP 110** card exchanges are executed at the same rate as the master task or the fast task.

The process data exchanged with the slaves can be accessed by %MW standard words. The number of words depends on the type of processor and the task in which the module has been declared. PL7 or Unity Pro standard function blocks are used to define the device parameters.

**Note:** In addition to supporting the CANopen protocol which uses V2.0A standard CAN identifiers on 11 bits, the card enables direct access to the CAN link layer via CAN V2.0B identifiers on 29 bits, used by the majority of CAN devices. In certain applications this enables simultaneous control of CANopen devices and dedicated CAN products.

(1) The SyCon field bus configurator software also makes it possible to describe the I/O configuration of Profibus DP bus for Modicon Premium and Modicon Quantum platforms and the I/O configuration of INTERBUS bus for Modicon Quantum platform.

(2) PL7 Micro/Junior/Pro software is compatible with TSX Micro and Premium paltforms, Unity Pro is compatible with Modicon M340, Premium and Quantum platforms.

#### **CANopen bus wiring system**

Different types of cable are available making it possible to create any type of application, including for harsh environments (for a definition of standard and harsh environments, see page 5/66.

Several connectors are available to meet any requirement: straight or 90° angled connectors, or angled connectors with the option of connecting a PC or diagnostic pocket PC.

Power can be supplied to the equipment by means of cables, cordsets and tap junctions: one AWG24 pair for the CAN signals, one AWG22 pair for the power supply and the ground.

In addition to the IP 20 wiring offer, there is also an IP 67 wiring offer.

# Presentation, description

### Modicon<sup>®</sup> Premium<sup>™</sup> automation platform TSX<sup>™</sup> SAY master module

TSX<sup>®</sup> SAY master module for AS-Interface<sup>®</sup> cabling system

#### Presentation

**TSX<sup>™</sup> SAY 1000** master module for the AS-Interface<sup>®</sup> cabling system enables the Premium<sup>™</sup> PLC to act as the AS-Interface master.

The AS-Interface cabling system is comprised of a master station (Premium PLC) and slave stations. The master that supports the AS-Interface profile successively interrogates the devices connected on the AS-Interface cabling system and stores the data (status of sensor/actuators, operational status of devices) in the PLC memory. Communication management on the AS-Interface line is completely transparent with regard to the PLC application program.

**TSX SAY 1000** master module with the AS-Interface M2E profile (*AS-Interface V2*) manages:

- Discrete slave devices (a maximum of 62 devices organized in 2 banks, A/B, with 31 addresses each),
- Analog devices (a maximum of 31 devices in bank A)
- Safety interfaces (a maximum of 31 devices in bank A).

The maximum number of **TSX SAY 1000** modules per PLC station or slot-PLC is either 1, 2, 4 or 8, depending on the type of processor or slot-PLC installed (see page 5/69).

An AS-Interface power supply must be used for powering the various devices on the line. Ideally, this power supply should be situated nearest to the stations with the largest power demands (see pages 8/37).

#### Description

**TSX SAY 1000** AS-Interface master module is standard format modules. Modules of this format are designed to slot into any position on the Premium PLC rack like any Input/Output module or application-specific module. The modules feature, on the front panel:

- 1 A display unit comprising 4 indicator lamps showing the module operating modes:
- □ RUN indicator lamp (green): module operating,
- ERR indicator lamp (red): module detected fault,
- □ A/B indicator lamp (green): display of group of 32 slaves,
- □ I/O indicator lamp (red): AS-Interface line I/O detected fault.
- 2 A display unit comprising 32 indicator lamps for diagnostics of the AS-Interface line and of each slave connected to the line depending on the A/B pushbutton selected (1).
- 3 Two or three indicator lamps specific to the module: see diagnostics on page 9/69.
- **4** Two pushbuttons: see diagnostics on page 9/69.
- 5 One 3-way male SUB-D connector for connection to the AS-Interface cable (female screw connector supplied).

(1) Depending on the selection made with the A/B pushbutton, the first 31 slaves (standard address settings) or the last 31 slaves (extended address settings with AS-Interface V2) are displayed.

TSX SAY 1000

Schneider Gelectric

## Diagnostics, references. connections

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform TSX<sup>™</sup> SAY master module

for AS-Interface® cabling system

#### **Diagnostics**

#### TSX<sup>™</sup> SAY 1000 module (AS-Interface<sup>®</sup> V2)

The two indicator lamps 3 on the front panel of the TSX SAY 1000 module that correspond to the two pushbuttons 4 are used for diagnostics at module level:

Indicator lamps r	narked:	Pushbuttons man	rked:
PWR: AS-Interface power supply present	FAULT: AS-Interface line detected fault		MODE: module Off line/On line

The display unit on the front panel of the TSX SAY 1000 master module allows simplified local diagnostics to be performed by displaying the slave devices on the AS-Interface line. Detailed diagnostics for each of these slave devices can be carried out via the ASI TERV2 adjustment console.

#### Connections

**TSX SAY 1000** 

### Schneider

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform

Master modules for AS-Interface<sup>®</sup> cabling system

#### Software setup

- PL7<sup>™</sup> Micro/Junior/Pro software. Features include:
- Management of profile tables, parameters and data by the master (this management is transparent to the user).

Topological I/O addressing: each AS-Interface slave declared on the line is assigned a topological address on the bus. This is transparent to the user.
 Each sensor/actuator for the AS-Interface is treated as an in-rack I/O by the

TSX Micro<sup>™</sup>/Premium<sup>™</sup> PLC.

Declaration of the TSX SAZ 10 TSX Micro module

Configuration of AS-Interface slave devices in TSX SAY 1000 Premium module

#### AS-Interface® cabling system configuration

Devices on the AS-Interface line are configured implicitly using the following sequence of screens:

Declaration of the AS-Interface master module

■ The TSX<sup>™</sup> SAZ 10 module is always inserted and declared in position no. 4 on TSX<sup>™</sup> 37 10/21/22 TSX Micro automation platforms.

■ TSX<sup>™</sup> SAY 1000 modules can be inserted into any position on Modicon<sup>®</sup> Premium<sup>™</sup> automation platforms (except positions reserved for processors and power supplies).

#### Configuration of AS-Interface slave devices

Using the configuration screen, it is possible to configure the slave devices corresponding to interface I/Os on the AS-Interface cabling system. Depending on its type, the configuration for each device consists of defining, as appropriate: Schneider Electric AS-Interface devices.

The user selects the AS-Interface device catalog reference from the various discrete, analog, or safety interfaces listed. This selection automatically determines the AS-Interface profile and the parameters associated with each interface.

Third-party AS-Interface device.

The user can use Unity<sup>™</sup> Pro or PL7<sup>™</sup> Micro/Junior software to manage a "customized" list of sensors/actuators of different brands. This list, specifying the AS-Interface profile and parameters, is compiled to meet the needs of the user.

#### Programming

After configuration, the I/Os connected on the AS-Interface line are processed by the application program in the same way as an in-rack I/O of the PLC, using either the address (e.g. 14.0 for 16.2, input 2 of slave 16 of the AS-Interface line), or the associated symbol (e.g. Start\_conveyor).

Unity Pro or PL7 Junior/Pro software has an integrated function block library containing the specific diagnostic DFBs for AS-Interface line. Its check for the appearance of any detected error on the AS-Interface (line or slaves) or, if they are present, on the AS-Interface "Safety at work" monitors **ASI SAFEMON**•.

## Diagnostics, characteristics

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform

Master modules for AS-Interface<sup>®</sup> cabling system

#### **Diagnostics**

Diagnostics of the TSX SAY 1000 module using PL7

Diagnostics performed using the centralized display unit of the TSX Micro<sup>™</sup> platform or using the display unit of **TSX**<sup>™</sup> **SAY 1000** module can be completed using a PC terminal on which Unity<sup>™</sup> Pro or PL7<sup>™</sup> Micro/Junior/Pro software has been installed.

The terminal connected to the TSX Micro<sup>™</sup> or Premium<sup>™</sup> PLC is used to perform diagnostics of the operating state of the:

- TSX SAZ 10 and TSX SAY 1000 master module,
- AS-Interface<sup>®</sup> line,
- Slave devices on the line.

For the AS-Interface V2 **TSX SAY 1000** master module, the diagnostics takes into account developments in the M2E standard.

Diagnostics are performed using a single screen divided into four sections providing information on:

- 1 Status of the TSX<sup>™</sup> SAZ 10 or TSX SAY 1000 module (RUN, ERR, I/O).
- 2 Status of the AS-Interface channel connected to the module.
- 3 Inoperative interface (or slave).

4 Data relating to any selected interface (profile, parameters, forcing, etc).

In the event of an AS-Interface module or channel detected fault, a second screen can be accessed, which clearly shows the type of detected fault that may be at internal or external level.

Characteristics				
Type of module		TSX <sup>™</sup> SAZ 10	TSX™ SAY 1000	
AS-Interface <sup>®</sup> profile		M2(AS-Interface V1)	M2E (AS-Interface V2)	
Type of addressing		Standard	Standard and extended	
Product certification		AS-Interface No. 12001, IEC/EN 61131-2	Pending	
Ambient air temperature Operation Storage		0+60 °C.	·	
		-25+70 °C.		
Degree of protection		IP 20		
Vibration resistance		Conforming to IEC/EN 60068-2-6. Fc tests.		
Shock resistance		Conforming to IEC 60068-2-27. EA tests.		
Number of connectable interfaces	With standard addressing	31 slaves		
(or slaves)	With extended addressing	-	31 slaves	
Type of connectable interfaces	With standard addressing	Discrete I/Os (4I/4O)	Discrete I/Os (4I/4O) (1) Analog I/Os (a maximum of 4 channels) Safety interfaces	
	With extended addressing	-	Discrete I/Os (4I/3O)	
Line connection		By terminal block inside module (polarity locating device)	By 3-way SUB-D connector (included with the module)	
Module power supply		Via power supply integrated into the host platf	orm of the module	
Display/diagnostics		Via: - centralized display unit on TSX Micro PLC or via the display unit of TSX SAY 1000 module - use of the Unity Pro or PL7 Micro/Junior/Pro software diagnostics function - use of the ASI-TERV1 adjustment console (infrared link)		
		(1) If the interfaces are connected using extend (instead of 4I/4O).	led addressing, the type of discrete I/Os is 4I/3O	

### Modicon<sup>®</sup> Premium<sup>™</sup> automation platform AS-Interface<sup>®</sup> cabling system

AS-Interface<sup>®</sup> flat cables are available in two versions, yellow and black, according to the type of application: standard and TPE (resistant to splashing oil and to environments with petroleum vapors). Various tap junctions are available to meet multiple cabling needs. They have a degree of protection of IP 67.

#### **AS-Interface® infrastructure**

#### Installation

#### AS-Interface cable lengths

We recommend use of the flat yellow cable. The maximum length of an AS-Interface segment is 100 m, which can be extended to:

■ 200 m by using a repeater or a line extension:

■ 300 m with 2 repeaters.

**500 m** by placing the master in the center of the network:

- M = Master Module
- A = Supply
- S = Interface or component

**Note:** 300 m corresponds to the maximum distance between the master and the furthermost slave.

For more information on the installation of AS-Interface, please refer to section 5 of our "Machines and Installations with Industrial Communications" catalog.

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform

X-Way<sup>™</sup> communication

#### X-Way<sup>™</sup> / OSI model

#### The communication architecture of the programmable TSX Micro<sup>™</sup> and Premium<sup>™</sup> PLCs, like that of TSX<sup>™</sup> 17 or TSX<sup>™</sup> model 40 PLCs, is compliant with the OSI model.

■ The physical layer enables the physical transmission of data signals between 2 systems via a medium.

In order for a network to operate correctly, and to help ensure full security of personnel in compliance with IEC 1131 2, it is necessary to follow the instructions provided in the manual "Grounding and Electromagnetic Compatibility of PLC Systems" incuded on DVD UNY USE 909CDM reference.

■ The application layer concerns application programs, data exchange and cooperation conventions.

This layer provides the following services:

□ Industrial Uni-TE<sup>™</sup> message, available on TSX Micro<sup>™</sup>/Premium<sup>™</sup>/TSX PLCs.

Distributed COM database available on TSX Micro/Premium/TSX PLCs, or Shared Table service available on TSX Micro/Premium PLCs.

□ Periodical data exchange on Fipio bus, see page 5/80

□ Application-to-application communication.

□ Telegram.

Size of requests	Ethway <sup>™</sup> , Ethernet TCP/IP (1)	Fipway®	Fipio®	Uni-Telway <sup>™</sup>
Uni-TE <sup>™</sup> service	256 bytes (2)	128 bytes	128 bytes	240 bytes (3)
COM service	256 word database (4)	128 word database	-	-
Application-to- application	256 bytes	128 bytes	128 bytes	240 bytes (3)
Telegram	_	16 hytes	_	_

(1) Ethway not available on TSX Micro PLC.

(2) 1 K bytes with requests executed as a background task.

(3) 128 bytes on TSX Micro/Premium/TSX model 40 terminal port, 32 bytes on TSX 17 20 and TSX 47 20/25

(4) COM service not available with Ethernet TCP/IP.

#### Uni-TE<sup>™</sup> services

The Uni-TE protocol is the industrial message handling system supported by the X-Way<sup>™</sup> communication architecture. It operates on the question/answer or request/confirmation principle. A device which supports the Uni-TE protocol can be a:

Client: this device initiates communication. It asks a question (reads), transmits data (writes) or sends an instruction (Run, Stop, etc.).

Server: this device executes the service requested by the client and sends a confirmation after execution.

X-Way / OSI model (continued)

### Modicon<sup>®</sup> Premium<sup>™</sup> automation platform X-Way<sup>™</sup> communication

The services provided depend on the type of device (PLC, numerical controller, programming terminal, supervision station, etc.). Depending on its function, each device can be Client and/or Server. A Client PLC can access other devices on the architecture via its application program: It can read/write objects on another PLC or numerical controller, select programs on a numerical controller, etc.

#### Network transparency

When connected to any station in the network or directly connected to the Fipway<sup>®</sup>/ Ethernet TCP/IP network, a programming terminal can communicate with any other station in the network, as if the terminal were physically connected to the PLC. Network transparency also applies between stations connected to different segments of the same multinetwork architecture.

**COM service and Shared Table service** (exclusive services one from another) **The COM service** is made up of a set of dedicated words called common words. Each Fipway/Ethway<sup>™</sup> network station may or may not access the database (in read only or read/write mode).

PLC stations exchanging common words (32 stations on Fipway, 64 stations on Ethway) are allocated, in a dedicated database (128 words for Fipway, 256 words for Ethway), a write zone (set at 4 words for the Fipway network, and variable from 4 to 64 words for the Ethway network) per TSX Micro<sup>™</sup>/Premium<sup>™</sup> station. COM words are updated automatically during each scan of the general sequential program (master task) without the intervention of the application program.

The Shared Table service can be used to exchange a table of internal words divided into as many zones as there are TSX Micro/Premium PLCs in the Fipway® network. The exchange principle is based on the broadcasting, by each PLC, of a word memory zone (broadcast zone) to the other PLCs on the network. Each network station is allocated an exchange table comprising 128 internal words for the 32 PLCs that share the service, with a broadcast zone assigned to each PLC, variable from 1 to 32 internal words.

#### Application-to-application communication

This consists of using the user application program to send word tables between 2 devices, which may be TSX Micro/Premium and TSX PLCs.

- This service is particularly suitable for:
- Sending alarm messages from a PLC to a supervision station.
- Exchanging data tables between two PLCs controlled by the application programs of the transmission and destination device.
- Sending broadcast messages to stations and devices.

#### Telegram

The telegram service available on Fipway is a special case of application-toapplication messages. It enables short messages to be sent and received on a priority basis (maximum 16 characters).

A telegram from a TSX Micro/Premium PLC is sent immediately without waiting for the end of the cycle. The telegram is received by the TSX Micro/Premium PLC in: The event-triggered task (processed as soon as the message arrives in the

- network card)
- The fast task or master task (when scanning the reception function).
- A PLC can only process one telegram at a time.

#### Use in a multinetwork

The X-Way<sup>™</sup> communication architecture is designed to cover multinetwork applications capable of dealing with problems of:

Concentration, the architecture is particularly suitable for feedback of supervision data to a higher level.

■ Redundancy, each PLC monitors the correct operation of both networks to which it is connected. If one of the networks does not respond, traffic could be transferred to the valid network.

■ Inter-network communication. These architectures are comprised of several network segments which are interconnected by "bridge PLC" stations. Transparent communication is then offered between the entire architecture.

## Presentation, connectable devices

### Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Fipio<sup>®</sup> bus manager function

Presentation

The Fipio<sup>®</sup> fieldbus is a standard means of communication between different control system components. It enables 127 devices to be connected at the connection point integrated in the processor. This fieldbus conforms to the WorldFip standard based on producer/consumer mechanisms. It is designed for remote location of I/O up to 15 km away and enables a third-party Schneider Alliances device to be installed.

The bus arbitrator (manager) can be a :

□ Modicon® Premium<sup>™</sup> PLC TSX<sup>™</sup> P 57 15e/25e/2823/35e/45e/4823/554M

Characteristics of Fipio bus, see page 5/81. Fipio bus accessories and connecting cables, see pages 5/86 to 5/89

#### **Connectable devices**

Schneider Electric devices which can be connected on the Fipio bus include: □ Micro<sup>™</sup>/Premium<sup>™</sup> PLCs Agent function via PCMCIA **TSX FPP 10** card □ Magelis<sup>®</sup> XBT GT/GK/GTW Advanced Panel, via **TSX CUSBFIP** USB/Fipio adaptator

□ Magelis<sup>®</sup> Compact iPC/Smart BOX/Compact PC BOX/Flex PC BOX, via **TSX CUSBFIP** USB/Fipio adaptator

□ Advantys<sup>™</sup> STB distributed I/O with **STB NFP 2212** network interface module □ Momentum<sup>™</sup> distributed discrete, analog or application-specific I/O with

170 FNT 110 01 communication

- □ Distributed discrete dust and damp proof I/O TSX E●F (IP 67).
- □ Altivar<sup>®</sup> 61/71 variable speed drive, via VW3 A58301/311 card)
- D PC terminal, via TSX CUSBFIP USB/Fipio adaptator

□ TBX distributed discrete or analog I/O (IP 20) with TBX LEP 030 communication module (legacy range)

□ Partner products of Collaborative Automation Partner program.

Find out more about the "Collaborative Automation Partner Program" at : www.collaborativeautomation.schneider-electric.com

## Description, software setup

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform

Fipio<sup>®</sup> bus manager function

TSX P57 153M/154M

T PCX P57 354M

TSX P57 454/554M

#### Description

- TSX™ P57 ●53/54M processors and the TSX™ PCI 57 354M slot-PLC all have on the front panel:
- 9-way SUB-D connector. for connection to the bus via the TSX<sup>™</sup> FP ACC2/12 1 connector.

#### Software setup

#### Configuration

Unity<sup>™</sup> Pro or PL7<sup>™</sup> Junior/Pro software offer configuration screens that help to enable the declaration and intuitive configuration of the remote devices connected on the Fipio® bus.

- Each circle represents one connection point. 1
- 2 Clicking on a circle accesses the catalog of devices which can be connected.
- 3 Once confirmed, the Fipio bus configuration will appear.

Processors fitted with the integrated Fipio link can manage 128 connection points on the bus (addresses 0 to 127).

See page 5/78 of this catalog for the table detailing limitations according to processor and type of device.

#### Diagnostics

The diagnostic functions of the Fipio bus, integrated in the Unity Pro software or PL7 Junior/Pro software, very quickly identify detected faults on:

- □ The bus medium
- □ Remote devices.
- A graphic representation of the architecture displays the defective devices in red. 1
- More detailed diagnostics can be accessed by double-clicking. 2
- In addition, special screens display an overview of the detected faults appearing on 3 the bus or on any device. On request, these detected faults can be recorded for later analysis.

### Application services, references

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform

Fipio<sup>®</sup> bus manager function

#### **Application services**

When using the bus manager function, the application services supported by the Modicon<sup>®</sup> Premium<sup>™</sup> PLC are:

Remote I/O

Remote I/O modules are addressed by the PL7<sup>™</sup> application program as "In rack" I/O, with which they can coexist. This service enables the exchange of I/O status variables and output command variables. These exchanges are carried out in a cyclical and deterministic manner and without intervention from the application program.

The manager also manages remote devices (configuration) in an aperiodic manner, without intervention from the application program.

■ Uni-TE<sup>™</sup> service

X-Way<sup>™</sup> industrial message handling service suitable for MMI, diagnostics and control functions (requests of 128 bytes maximum).

Application-to-application service

This service consists of sending tables between 2 devices under the control of their respective application programs (requests of 128 bytes maximum).

Terminal transparency

Terminals connected on a higher level X-way network or on the manager PLC terminal port communicate with the devices on the bus. This is also the case when the terminal is connected at the priority address 63.

### Presentation, functions, description

### Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Fipio<sup>®</sup> bus Agent function

#### Presentation

TSX Micro<sup>™</sup> (TSX 37 21/22) or the Modicon<sup>®</sup> Premium<sup>™</sup> PLC, fitted with a **TSX<sup>™</sup> FPP10** PCMCIA card on their integrated communication channel, are agents on the Fipio<sup>®</sup> bus (with Fipio bus manager).

The Fipio bus enables I/O to be remotely located close to the devices to be controlled (TeSys<sup>®</sup>, Advantys<sup>™</sup> STB, Momentum<sup>™</sup>, Altivar<sup>®</sup> and Lexium<sup>®</sup>). The Agent function enables offline processing, by locating a TSX Micro PLC close to the machine.

In addition to the standard Fipio services (see pages 5/74 to 5/75), TSX Micro (TSX 37 21/22) and Premium PLCs allow exchanges of input and output variables with the bus manager PLC. These exchanges are performed cyclically, automatically and without the involvement of the application program at the same rate as the task for which the agent PLC has been configured.

Fipio bus wiring system and connection accessories, see pages 5/86 to 5/89.

#### **Application services**

The application services supported by TSX Micro (TSX 37 21/22) and Premium Agent function PLCs are:

Uni-TE<sup>™</sup> service, X-Way<sup>™</sup> industrial message handling service suitable for operator dialog, diagnostics and control functions (requests of up to 128 bytes).
 Application-to-application communication service, which consists of the

transmission of tables between 2 devices controlled by their respective application programs (messages of up to 128 bytes).

■ New periodic data exchange service for exchanging a 64 word table between the bus manager PLC and the Premium Agent PLC. Sofware setup see page 5/81.

#### Description

TSX Micro (TSX 37 21/22)/Premium PLCs have a slot in the processor for a type III PCMCIA communication card. This can be fitted with a **TSX FPP10** Fipio bus connection card. The **TSX FPP10** card is comprised of:

- 1 A protective cover.
- 2 A removable cover with fixing screws giving access to the 20 way miniature connector.
- 3 Two indicator lamps:
- ERR lamp: detected card or link fault,
- COM lamp: transmission or reception of data.

#### Connector to be ordered separately:

4 TSX FP CG010/030, 1 or 3 m cable for connecting the TSX FP ACC4 tap junction (on 9-way SUB-D connector).

### Characteristics, software setup, references

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Fipio<sup>®</sup> bus Agent function

#### **Characteristics**

				The Fipio <sup>®</sup> industrial fieldbus is standard of communication between various control system components. It conforms to the WorldFip standard.
Type of Bus/ne	twork			Bus Fipio
Structure	Туре			Open industrial fieldbus conforming to WordFip standard
	Topology			Devices linked by daisy-chaining or tap link connections
	Maximum leng	jth	m	15 000
	Access metho	d		Producer/consummer principal Management by fixed arbitrator
Transmission	Mode			Physical layer in baseband on shielded twisted pair, conforming to NF C 46 604
	Data rate		Mbit/s	1
	Medium			150 ] shielded twisted pair, 62.5/125 or 50/125 fiber-optic using electrical/fiber-optic repeaters
Configuration	Number of	Per segment		32 connection points per segment
	devices	Maxi		128 on all segments
	Segments	Number		Unlimited
		Length	m	1 000 maxi per electric segment 3 000 maxi per optical segment
Services	Input/output ex	kchanges		Periodic and deterministic exchanges of variables between bus manager PLC and Agent PLC (64 %MWi consecutive words: 32 %MWi for transmission and 32 %MWi for reception)
	Uni-TE™			Point-to-point requests with confirmation report: 128 bytes maximum, can be used by devices connected to the same X-Way <sup>™</sup> architecture (access by the Client device to the Server device system functions)
	Application-to-application			Point-to-point messages: 128 bytes maximum between 2 devices, can be used by TSX Micro(1)/Premium/TSX Series 7
	Security			Control characters in each frame and acknowledgement of point-to-point messages conforming to standard NF C46-603

#### Software setup

Each TSX Micro<sup>™</sup> and Premium<sup>™</sup> PLC Fipio<sup>®</sup> Agent uses 64 %MWi consecutive internal words to exchange periodic data. The first 32 words are reserved for sending data to the manager, and the remaining 32 are reserved for receiving data from the manager.

Unity<sup>™</sup> Pro or PL7<sup>™</sup> Micro/Junior/Pro application-specific screens allow the configuration of the Fipio Agent PCMCIA card. This consists of indicating the:

■ connection point number (1 to 127).

■ address at the beginning of the 64 %MW word table reserved for sending data to and receiving data from the manager.

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform

Fipway<sup>®</sup> network

## Presentation Ethernet TCP/IP Modicon® Premiun Filmen Premium TSX\* series T8X\*17.20 Bus X Extension

The Fipway® network is an open local area network for communication between the various TSX Micro<sup>™</sup>, Modicon<sup>®</sup> Premium<sup>™</sup> and TSX<sup>™</sup> Series 7 PLCs using X-Way<sup>™</sup> services. Communication conforms to the FIP standard with access via a bus arbitrator.

TSX Micro (TSX 37 21/22) and Premium PLCs can be connected to a Fipway network using a Fipway PCMCIA card inserted in each processor or into the TSX SCY 21601 (Premium) communication module. Supported X-Way<sup>™</sup> services (see pages 5/75 to 5/75) are:

- □ Uni-TE<sup>™</sup> services
- Distributed database (COM) or Shared Table

□ Telegram (service only available when the PCMCIA card is inserted in the processor)

□ Application-to-application communication.

Fipway network wiring and connection accessories, see pages 5/86 to 5/89.

#### Performance

The operating principle of a Fipway network provides constant network cycle times whatever the traffic and number of stations (2 to 64). This enables the Fipway network to be updated (addition or removal of stations) without affecting its performance.

Maximum transmission time

■ Telegram (TLG): priority application messages are transmitted in less than 10 ms (one telegram per station).

■ Common words (COM): the database of common words is updated every 40 ms. Shared Table: the exchange table is updated every 40 ms.

Uni-TE<sup>™</sup> message handling system: Uni-TE or standard application-to-application messages are normally transmitted in less than 80 ms (40 ms for stations with addresses below 32). Where there is a large amount of traffic, some messages can wait for several cycles before being transmitted. The network characteristics enable a maximum of 210 messages of 128 bytes per second to be transmitted.

The performance can be improved by inhibiting the Telegram service in the network. With such network characteristics, the response time at application level depends almost exclusively on the processing capacity of the devices which are connected. For example, the remote loading of a 50 K word program takes less than two minutes on a network with normal load.

CT1 = Cycle time of device 1.

NCT = Cycle time of Fipway network.

CT2 = Cycle time of device 2.

The response time must be evaluated by the designer of each application in relation to the devices connected.

The processing time of a device can vary from one to two cycle times as a function of asynchronous operation.

Presentation

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform

Fipio®/Fipway® optic transceiver

### Presentation

The **OZD FIP G3** optic transceivers are particularly adapted for use with applications which are subject to harsh electrical environments or which are distributed over large areas:

- Public buildings.
- Large-scale industrial sites.
- Water treatment and distribution.
- Transport and highway tunnel infrastructures, etc.

The **OZD FIP G3** optic transceiver enables conversion of a FIP electric interface to 2 FIP optic interfaces and vice versa. As a result, it allows redundant ring topologies to exist; these improve installation availability even when a line is broken at a point in the medium.

In these situations, the length of the bus or the Fipio/Fipway ring can reach:

- 20 km, with a max. 32 transceivers on Fipio<sup>®</sup>
- □ 20 km, with a max. 20 transceivers Fipway®

See characteristics on page 5/85 of this catalog.

These characteristics may be enhanced using mixed topologies such as 2 serial optic rings or 2 serial optic buses; please consult our regional office.

#### Wiring system

- 1 OZD FIF GG3: Fipio<sup>®</sup>/Fipway<sup>®</sup> optic transceiver.
- 2 TSX<sup>™</sup> FP CA●00: 150 ] shielded twisted pair trunk cable (Ø 8 mm) for use in standard environments and inside buildings (1).
- 3 TSX FP CG 0●0: tap-off connection cable for TSX FPP10/OZD200 PCMCIA card for TSX Micro™/Premium™ PLCs.
- **TSX FP ACC3/4:** T-junction box. It also has two 9-way female SUB-D connectors for connecting any device which connects to the bus by a PCMCIA card.
- 5 TSX FP ACC2/12: 9-way female SUB-D connector for Fipway/Fipio connection using daisy chaining or tap link connection.
- 6 TSX FP ACC7: line terminator to be placed at each segment end. TSX LES 65: terminal block for TSX<sup>™</sup> Series 7 PLC, which performs the address coding.

(1) Trunk cable TSX FP CRe00 for use in harsh environment and ouside building, see page 5/89

### Presentation (continued), characteristics. references

# Modicon<sup>®</sup> Premium<sup>™</sup> automation platform

Fipio<sup>®</sup>/Fipway<sup>®</sup> optic transceiver

#### **Operating mode and performances**

#### ■ Fipio<sup>®</sup> bus on fiber-optic

After configuration in Fipio mode, the processor scans the various application devices according to the software configuration:

□ Image variables of the input values and of the output command values of a configured device are scanned as quickly as possible on the bus, whilst respecting the existing relationships between periods of different tasks which use these devices. □ Appearance or disappearance of a configured device is detected on the bus within a maximum time of 200 ms.

□ Exchanges occur at the rate defined by the programmer, from 10 to 20 Uni-TE<sup>™</sup> messages per second.

The network cycle time is double that of the electrical bus when OZD FIP G3 transceivers are used.

Fipway bus on fiber-optic

The operating principle is identical to that on an electrical network, in that the number of stations is limited to 32 and the transmission time is as follows:

For the Common words and Shared Table services, updating of the entire database is carried out every 40 ms maximum.

□ For Uni-TE<sup>™</sup> message handling, the network characteristics are used to transmit a maximum of 230 messages of 128 bytes per second.

Fipway network Reference

Characteristics (with	OZD FIP G3 optic transceivers) (1)				
Type of bus/network		Fipio <sup>®</sup> bus	Fipway <sup>®</sup> network		
Structure	Туре	Open industrial support conforming to Fip standard

Fipio<sup>®</sup> bus and Fipway<sup>®</sup> network

#### Cables

- 1 TSX<sup>™</sup> FP CAe00: trunk cable, shielded twisted pair 150 [] (Ø 8 mm) for normal environments and use inside buildings
- TSX FP CRe00: trunk cable, shielded twisted pair 150 [] (Ø 9.5 mm) for harsh environments and use outside buildings.
- TSX FP CPe00: trunk cable, shielded twisted pair 150 ∏ and 1 x 1.5 mm<sup>2</sup> pair for remote supply (Ø 9.5 mm) for harsh environments and use outside buildings.
- 3 TSX FP CCe00: tap link cable, shielded twisted pair 150 [ (Ø 8 mm) for normal environments and use inside buildings.
- TSX FP CG0e0: cordset for PCMCIA TSX FPP10/20/OZD200 communication card for TSX Micro<sup>™</sup>/Premium<sup>™</sup>/TSX Series 7 PLCs or TSX CUSBFIP USB/FIP adapter. Connection to the bus is via a 9-way SUB-D connector on the TSX FP ACC3/ACC4 junction box.

#### **Connection boxes**

- 6 TSX FPACC14: Polycarbonate IP 20 junction box: provides tap link from the trunk cable to connect 1 device via TSX FP CC•00 tap link cable or several devices in a daisy chain.
- TSX FPACC3: IP 20 box for connecting 2 TSX FPP10/20/OZD200 PCMCIA 7 cards or TSX CUSBFIP USB/FIP adapter on a 9-way SUB-D connector.
- TSX FP ACC4: IP 65 junction box. It also has a 9-way female SUB-D connector 8 for the TSX FPP10/20/OZD200 PCMCIA card or TSX CUSBFIP USB/FIP adapter (in this case, the box is IP 20).

TSX EF ACC99: IP 65 junction box for IP 67 I/O modules, see page 3/39.

#### Connectors

- TSX FPACC2 and TSX FPACC12: 9-way female SUB-D connector for 9 Fipway®/Fipio® connection (TSX FP ACC2 connector dedicated to TSX 17 20 micro-PLC). Used for daisy chain or tap link connection (90° output high or low, 45° output high or low).
- 10 TBX BLP01: connector for TBX IP 20 I/O modules (legacy range).
- 11 TSX LES65: connecting cable for TSX/PMX model 40 PLCs (legacy range). Used for address coding.
- 12 TSX FP ACC6: electrical repeater: used to increase the number of stations (max 64) and the length of the network by creating an additional segment of up to 1000 m (a maximum of 4 repeaters in cascade giving a network length of 5000 m).

TSX<sup>™</sup> EF C●●●: dust and damp proof connectors for IP 67 I/O modules, see page 3/39.

#### Other elements

- 13 TSX FP ACC8M: fiber-optic/electrical repeater: used to connect electrical segments via a fiber-optic link (particularly suitable for zones with a high level of interference) or to connect a fiber-optic device.
- 14TSX FP ACC7: Line terminator, to be installed at both ends of a segment.
- 15 TSX<sup>™</sup> CUSBFIP : USB/Fipio-Fipway adapter for connecting any device with USB port (Magelis® XBT Ge, PC terminal, Magelis® iPC industrial PC).

TSX FP JF020: fiber-optic jumper (length 2 m). For fiber-optic connection of the TSX FP ACC8M repeater to a patch panel. The maximum length of the fiber-optic cable (62.5/125) between 2 repeaters is 3000 m.

TSX EF ACC7: line terminator, to be installed at both ends of a segment requiring IP 67 protection, see page 3/39

TSX FP ACC9: network wiring test tool. This is used for testing the continuity of segments, the connections of the various devices and the installation of line terminators

(1) The characteristics and performances of the Fipio bus/Fipway network are dependent on the above TSX FP accessories being used.

(2) Normal environment:

- without special environmental restrictions,
- operating temperature between + 5 °C and + 60 °C,
- fixed installations. (3) Harsh environment:
- resistance to hydrocarbons, industrial oils, detergents, solder chips,
- up to 100% humidity,
- saline environment,
- extreme variations in temperature. - operating temperature between - 10 °C and + 70 °C,
- mobile installations.
- (4) Mobile installations: cables as per VDE 472, part 603/H:
- for use on cable drag chain with minimum bend radius of 75 mm,
- for use on gantry crane (strikethrough: portal support), subject to compliance with conditions for use such as acceleration, speed, length etc: contact our regional branch office for further information.
   not authorized for use on robots, or multi-axis applications.

# Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Modbus Plus<sup>™</sup> network

The Modbus Plus<sup>™</sup> network is a high-performance industrial local network which can respond to Client/Server type extended architectures, combining a high data rate (1 Mbit/s), simple and economical transmission support, and several message handling services.

The main data exchange functions between devices connected to the network are: ■ The message exchange function according to the Modbus<sup>®</sup> protocol.

The "global database" function (Shared Table service, periodic, controlled by the application: a station with the token can send 32 words to a maximum of 63 other stations connected on the network).

- 1 The Modicon<sup>®</sup> Premium<sup>™</sup> or TSX Micro<sup>™</sup> client communicates with the Modicon<sup>®</sup>Quantum<sup>™</sup> server on the Modbus Plus<sup>™</sup> network via function block (communication function).
- 2 The Quantum client communicates with the Premium server on the Modbus Plus network via MSTR function blocks.
- 3 A Premium (or TSX Micro) client connected to the Ethernet TCP/IP or Fipway® network can communicate in read/write mode with a Modbus Plus station (the Premium PLC therefore acts as a gateway).
- 4 A Premium (or TSX Micro) client connected to the Modbus Plus network can access a remote station via the Modbus Plus/Modbus gateway.
- 5 A Premium client connected to the Modbus Plus network can make exchanges with the Momentum<sup>™</sup> distributed inputs/outputs via the Peer cop function.

### Description, characteristics

# Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Modbus Plus<sup>™</sup> network

### Description

The type III TSX<sup>™</sup> MBP 100 card is used to connect the Modicon<sup>®</sup> Premium<sup>™</sup>/TSX Micro<sup>™</sup> PLCs to the Modbus Plus<sup>™</sup> network. This card is installed in the slot reserved for processors or slot-PLC features:

- 1 Host slot on processors or slot-PLCs.
- 2 Protective cover.
- 3 Removable cover with fixing screw (access to 20-way miniature connector).
- 4 Two indicator lamps:
  - ERR: detected card or link fault,
  - COM: activity on the line.

To be ordered separately: TSX<sup>™</sup> MBP CE 0●● drop cables.

Characteristics					
Structure	Туре	Industrial bus

# Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Modbus Plus<sup>™</sup> network

- 1 TSX<sup>™</sup> MBP 100: Modbus Plus<sup>™</sup> PCMCIA card, for type III processor slot on Modicon<sup>®</sup> Premium<sup>™</sup> or TSX Micro<sup>™</sup> platforms.
- 2 170 PNT 110 20: communication module for Momentum<sup>™</sup> I/O base unit.
- 3 490 NAA 271 0e: trunk cable, shielded twisted pair with shielding drain (flying leads). In lengths of 30, 150, 300, 450 or 1,500 m.
- 4 170 MCI 020/021 ●•: drop cable equipped at each end with an RJ45 connector (baseT interface). In lengths of 0.25, 0.75, 3 or 10 m.
- 5 990 NAD 230 00: IP 20 local site tap, provides a tap link from the trunk cable for connecting 1 device (connection of conductors requires wiring tool 043 509 383). Integrates the line terminal.
- 6 Local site taps provides a tap link from the trunk cable for 1 device (screw terminal connection). It also has an RJ45 connector for connecting a programming and maintenance terminals:
  - 990 NAD 230 20/21: IP 20 plastic tap,
  - 990 NAD 230 10: IP 65 zamac tap.
- 7 170 XTS 020 00: IP 20 tee, provides a tap link from the Modbus Plus cable (cable with connectors at each end of an RJ45 connector). It has a 9-way SUB-D female connector for connecting the device.
- 8 TSX MBP CE 030/060: drop cable for Modbus Plus PCMCIA card, equipped on the PCMCIA side with a 20-way miniature connector and with flying leads on the 990 NAD 230 00/10 local site tap side. In lengths of 3 or 6 m.
- 9 990 NAD 211 10/30: drop cable with a 9-way SUB-D male connector for connecting the device and with flying leads on the 990 NAD 230 00/10 local site tap side. In lengths of 2, 4 or 6 m.
- 10 TSX MBP CE 002: drop cable for Modbus Plus PCMCIA card, equipped on the PCMCIA side with a 20-way miniature connector and on the network side with a 9-way SUB-D female connector. Can be used as an extension for cable 990 NAD 211 10/30. In lengths of 0.2 m.
- 11 AS MBKT 185: set of 2 line terminators (impedance adapter) to be placed at each end of the segment. The AS MBKT 185 terminators are placed directly at the end of the cable (without a tap or tee).
  - 990 NAD 230 11: set of 2 line terminators (impedance adapter) for IP 65 local site tap 990 NAD 230 10, to be placed at each end of the segment.
- 12 170 XTS 021 00: set of 2 line terminators (impedance adapter) for tee 170 XTS 020 00, to be placed at each end of the segment.

Note: For wiring system:

- Quantum<sup>™</sup> platform: please refer to our catalog.
- Lexium® drive for brushless motors: please refer to our catalog "Lexium motion control".

- Altivar® drive for asynchronous motors: please refer to our catalog "Soft starters and speed drives"

### Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Profibus DP<sup>™</sup> bus

### Presentation

The Profibus  $DP^{\mathbb{M}}$  bus is a high-speed fieldbus which conforms to industrial communication requirements.

The Profibus DP is a linear bus with a centralized access procedure of the master/slave type. Only master stations, also known as active stations, have access rights to the bus. The slave or passive stations can only respond to prompts. Dialog between masters is also possible from some stations by means of a token bus protocol. The physical connection is a single shielded twisted pair, but fiber-optic interfaces are available to create tree, star, or ring structures. Compared to the ISO model, only layers 1, 2 are implemented, since access from the user interface is made directly to the link layer via simple mapping of variables.

#### Configuration

The Profibus DP bus is configured usind dedicating SyCon<sup>®</sup> software, which should be ordered separatly, reference SYC SPU LF• CD28M.

This sofware is used to generate the file including the information relating to the devices connected. This extension file is imported into the PLC application via the Unity<sup>m</sup> Pro or PL7<sup>m</sup> Junior/Pro programming software.

#### Description

Premium<sup>™</sup> PLCs are connected to the Profibus DP bus by a **TSX<sup>™</sup> PBY 100** module. This module can be installed in any slot in the Premium PLC rack. It is comprised of:

- 1 Host module for the PCMCIA card.
- 2 Profibus DP PCMCIA card with its integral connecting cable, 0.6 m long.
- 3 T-junction box enabling the tap link of the main bus **490 NAE 911 00**.

#### **Connectable devices**

The **TSX PBY 110** module performs the role of the master on the Profibus DP bus. The Schneider Ealectric devices (slaves) which can be connected on the bus are:

- TeSys® model U starter-controllers, via Modbus® gateway.
- Advantys<sup>™</sup> STB and Momentum<sup>™</sup> distributed I/O.
- Advantys<sup>™</sup> FTB/FTM, IP 67 monobloc and modular I/O spliter boxes.
- Altivar<sup>®</sup> 61/71, variable speed drives for asynchronous motors.
- Lexium<sup>®</sup> 15 servodrives for brushless motors.
- Altistart<sup>®</sup> ATS 48 soft starters.
- And any third-party device which conforms to the Profibus DP<sup>™</sup> standard profile.

### Modicon<sup>®</sup> Premium<sup>™</sup> automation platform INTERBUS<sup>®</sup> bus

### Presentation

The INTErBUS® bus is a serial link type fieldbus for sensors and actuators which conforms to the requirements of an industrial environment.

The topology of the  ${\sf INTERBUS}^{\circledast}$  bus is designed as a ring system with master/slave central access procedure.

It is subdivided into three parts:

- The remote bus 1 (bus devices use RS 485 point-to-point connection).
- The installation remote bus 2 (remote bus tap link via a bus terminal module). Its
- technology is particularly suitable for IP 65 dust and damp proof systems.

■ The local bus with TTL technology is particularly suitable for buses within a control cabinet.

Each bus subscriber is comprised of a transmitter and a receiver.

The INTERBUS system is like a data ring and has the structure of a shift register distributed on the bus. With its registers, each module constitutes a component of this shift register ring. The INTERBUS master circulates the data in series on this ring.

### Description, connectable devices

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform

INTERBUS<sup>®</sup> bus

TSX IBY 100

### Description

Modicon<sup>®</sup> Premium<sup>™</sup> PLCs are connected to the INTERBUS<sup>®</sup> bus via the TSX<sup>™</sup> IBY 100 INTERBUS bus module.

The front panel on the TSX IBY 100/IBX 100 module features:

- 1 Display block with 6 indicator lamps (on the card for the TSX IBX 100). 2 9-way female RS 232 SUB-D connector: CMD Tool software support (configuration software).
- 3 9-way female RS 485 SUB-D connector: InterBus link (this connector integrates an additional power supply for the fiber-optic link).

#### **Connectable devices**

The TSX IBY 100 module or the TSX IBX 100 card acts as the master on the INTERBUS® bus. Other Schneider Electric devices (slaves) that can be connected on the bus are:

- □ Altivar® 71/61 variable speed drives for asynchronus motors.
- □ Advantys<sup>™</sup> Telefast IP 20 I/O interfaces.
   □ Advantys<sup>™</sup> STB IP20 modular distributed inputs/outputs.
- □ Advantys<sup>™</sup> IP 67 FTB monobloc splitter boxes.
- □ Momentum<sup>™</sup> IP20 distributed inputs/outputs.
- □ Distributed discrete dust and damp proof I/O (IP 65).
- □ Inductel inductive identification systems (XGP/XGK-S read/write stations).
- □ AS-Interface<sup>®</sup>/INTERBUS gateway.
- □ Any third-party device conforming to InterBus standard profiles.

### Characteristics, software configuration

InterBus services		Implicit exchange of process date: 242 %IW and 242 %QW					
		Pre-processing					
		Logical addressing					
		Segmentation					

#### Software configuration

The INTERBUS® bus can be configured in 3 modes:

Auto mode: This mode does not require the use of any special configuration software (I/O images are copied to %IW, %QW implicitly). This facilitates the wiring check.

■ Mode Unity<sup>™</sup> Pro / PL7<sup>™</sup> → IBY mode: This mode is used to define and load the configuration to the module (explicit assignment of %IW, %QW). The CMD Tool software (1) is required in order to generate the configuration text file.

■ CMD → IBY mode: Reserved for configurations > 8 K words, and requires the use of the CMD Tool software.

PMS message handling (usable on PCP devices) is managed via standard OFs (Read-var, Write-var, etc).

The catalog file which enables Schneider Electric devices to be integrated in the CMD Tool software is available on our Web site:

- Address: <u>www.schneider-electric.com</u>
- File for downloading: Schneider device catalog for CMD.

TSX SCA 50

Description	Use	Reference	Weight kg
Passive junction box	Bus tap link and extension, line termination adaptation	TSX <sup>™</sup> SCA 50	0.520
2 channel passive subscriber socket (2 or 4 wire) <i>(2)</i>	Tap link of 2 devices with 2 wires Tap link of 1 master device and/or 1 slave device with 4 wires Fitted with 2 female 15-pin SUB-D connectors	TSX SCA 62	0.570
RS 485 TAP isolation	RS 485 line isolation (1) Line end adapter (RC 120 $\Omega$ , 1nF) Screw terminal for trunk cable and 2 x RJ45 for derivation = 24 V supply (screw terminal block) Mounting on 35 mm DIN	TWD XCA ISO	0,100
TER terminal port cable connector	Bus tap link cable (2 or 4-wire) Isolation of Modbus signals Line termination adaptation Supplied with cable (length 1 m) fitted with a mini-DIN connector (TER port)	TSX <sup>™</sup> P ACC 01	0.690
Active adapter RS 232/RS 485	Connection of an RS 232 device as RS 485 Isolation of signals and line termination adaptation	TSX SCA 72	0.520
Line terminators Sold in lot of 2	2/4-wire cabling Can be connected to the front panel of the TSX SCA 62 subscriber socket	TSX SCA 10	0.030

(1) PCMCIA slot for 1 TSX SCP 111/112/114 or TSX FPP 20 card.
(2) Line isolation recommended for the length > 20 m.

### Presentation, characteristics

# Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Uni-Telway<sup>™</sup> serial link

### **Presentation**

The Uni-Telway<sup>™</sup> bus is a standard means of communication between control system components (PLCs, MMI terminals, supervisors, variable speed drives, numerical controllers, weighing equipment, etc.).

It is suitable for architectures designed to manage control and monitoring devices via a PLC, or architectures used for MMI (supervision, etc.).

The Uni-Telway bus requires a master station which manages the allocation of bus access rights to the various connected stations (known as slave stations).

Character	istics							
Physical interface		RS 485 non isolated terminal port (TER/AUX)	Premium <sup>™</sup> RS 485 isolated module integrated port (1)	Isolated RS 485/RS 422 PCMCIA card	20 mA CL PCMCIA card	Non-isolated RS 232 PCMCIA card		
Structure	Туре	Heterogeneous industrial bus						
	Link	Multidrop		Point-to-point				
	Method of access	Master/Slave principle						
Transmission	Mode	Asynchronous transmission in baseband						
	Data rate	1.219.2 Kbit/s				0.319.2 Kbit/s		
	Medium	Shielded double twisted pair						
Configuration	Number of devices	5 max.	28 max.		16 max.	2		
	Number of connection addresses	8 max.	96 max.(1 device can occupy several datalink addresses)					
	Length of bus	10 m max., 1,000 m with <b>TSX<sup>™</sup> PACC 01</b>			1300 m max., excluding tap links	15 m (unlimited via modem		
	Tap links	-	20 m	20 m	15 m	-		
Service	Uni-TE <sup>™</sup>	Point-to-point requests	with confirmation (ques	tion/response), of up to 2	240 bytes (2) initiated by	any connected device		
		Unsolicited point-to-point data, without confirmation, of up to 240 bytes(2) initiated by any connected device						
		Broadcast messages of	f up to 240 bytes (2) init	ated by the master devic	ce			
	Other functions	Transparent communication, via the master, with any device in an X-Way <sup>™</sup> architecture						
		Diagnostics, debugging	Diagnostics, debugging, adjustment and programming of PLCs					
	Security	Check character on each frame, acknowledgement and, if required, repetition of messages helps to ensure security of transmission						
	Monitoring	Bus status table, transi	mission error counters a	nd device status can be	accessed by program in	each device		
	-	Status of the bus and d	evices connected from t	he master PLC accessib	le using Unity <sup>™</sup> Pro or F	PL7 <sup>™</sup> software.		

(1) TSX<sup>™</sup> SCY 21601 single format module.

(2) Limited to 128 bytes with TSX Micro/Premium PLC terminal port.

### Characteristics (continued), description

# Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Uni-Telway<sup>™</sup> serial link

Performance

The Uni-Telway<sup>™</sup> bus cycle time depends on:

- The number of devices polled (datalink addresses).
- The data rate.
- The turnaround time of each device.
- The number, length and type of messages.

BCT = Bus Cycle Time, is the interval between two polls from the same device.

The curves opposite give the Uni-Telway cycle time as a function of the number of slaves operating at 9.6 Kbit/s or 19.2 Kbit/s, with a typical turnaround time of 5 ms per device (excluding messages).

The following table shows the time to be added (in ms) to obtain the true BCT value as a function of the traffic (N = Number of usable characters):

Exchanges	Time (ms)			
	at 9.6 Kbit/s	at 19.2 Kbit/s		
Master to slave	24 + 1.2 N <i>(1)</i>	17 + 0.6 N <i>(1)</i>		
Slave to Master	19 + 1.2 N <i>(1)</i>	12 + 0.6 N <i>(1)</i>		
Slave to slave	44 + 2.3 N <i>(1)</i>	29 + 1.15 N <i>(1)</i>		

In a distributed control system architecture the application-to-application response time depends not only on the communication system, but also on:

The processing times of the message source and destination devices.

The degree of asynchronism between the bus and processor cycle times.

This response time must be evaluated by the designer of each application according to the devices which are connected.

The processing time of a device may vary from one to two cycle times depending on the degrees of asynchronism.

BCT = Uni-Telway bus cycle time

CT1 = Device 1 bus cycle time

CT2 = Device 2 bus cycle time

#### Description

Modicon<sup>®</sup> Premium<sup>™</sup>/ TSX Micro<sup>™</sup> PLCs

TSX Micro

- Modicon<sup>®</sup> Premium<sup>™</sup> and TSX Micro<sup>™</sup> PLCs provide various ways of connecting to the Uni-Telway<sup>™</sup> bus.
- 1 By integrated TSX Micro/Premium processor
  - The AUX port (2) (8-way mini-DIN) has one non-isolated RS 485 serial link channel (maximum distance 10 m).
- 2 By TSX SCY 21601 integrated port for Premium PLC This module has one Half-duplex isolated RS 485 serial link channel, which is multiprotocol, including Uni-Telway™.
- Via multiprotocol PCMCIA card 3
  - A slot on the TSX 37 21/22/Premium PLC processors and the TSX™ SCY 21601 module (3) accepts the following multiprotocol cards:
  - TSX SCP 114 PCMCIA card: isolated RS 485/RS 422 link. This type of card corresponds to the Uni-Telway standard.
  - TSX<sup>™</sup> SCP 111 PCMCIA card: non isolated RS 232 link. This type of card can be used for direct point-to-point links or via Modem.
  - TSX SCP 112 PCMCIA card: 20 mA current loop link. This type of card is used for a multidrop link (2 to 16 devices) and requires a == 24 V external power supply.
- (1) N = Number of usable characters corresponding to the messages to be exchanged.
- (2) TER port for TSX 37 05/08/10 PLC.

(3) This slot can also accept the TSX FPP 20 PCMCIA card for Fipway networks.

# Modicon<sup>®</sup> Premium<sup>™</sup> automation platform

Uni-Telway<sup>™</sup> serial link

Uni-Telway<sup>™</sup> bus wiring system

- 1 TSX<sup>™</sup> CSA ●●●: bus cable, double shielded twisted pair. The shielding must be connected to the ground of each device.
- 2 TSX<sup>™</sup> SCA 50: passive T-junction box, matches the impedance when it is installed at the end of the line.
- 3 TSX SCA 62: passive 2-channel Uni-Telway<sup>™</sup> subscriber socket, is used for coding the address of two connected devices, and matching the impedance when it is installed at the end of the line.
- 4 TSX SCA 60/61: passive terminal block, used for intermediate devices that have a 15-way female SUB D connector:
  - TSX SCA 60 used for intermediate devices,
  - TSX SCA 61 used for end devices.
- 5 TSX<sup>™</sup> PACC 01: connection box, used for connecting a TSX Micro<sup>™</sup>/Premium<sup>™</sup> PLC to the Uni-Telway bus via the PLC terminal port. The connecting cable (length 1 m) is integrated in the connection box. It isolates the signals (for distances >10 m) and is used to match the end of line impedance. It is also used to set the operation of the terminal port (Uni-Telway Master/Slave or character mode).
- 6 TSX<sup>™</sup> LES 64/74: cable connectors for extensions to the Uni-Telway bus, used to connect TSX model 40 PLC processors that have an integral Uni-Telway port as standard. They are used for coding the address of the connected device.
- 7 TSX<sup>TM</sup> SCP 114: PCMCIA card for connecting TSX Micro (1)/Premium PLCs to the Uni-Telway bus.
- 8 TSX SCP CU4030: Uni-Telway connecting cable between the TSX SCP 114 PCMCIA card (on TSX P57 •0M processor or TSX SCY 21601 module) and the TSX SCA 50 junction box.
- 9 TSX<sup>™</sup> SCY CU6530: Uni-Telway connecting cable between the **TSX SCY 21601** module integrated channel and the TSX SCA 62 subscriber socket.
- 10 VW3 A8 306: universal connecting cordset (length 3 m) between the Magelis<sup>®</sup> XBT G• Advanced Panel (port COM2, RJ45 connector) and the TSX SCA 62 subscriber socket.
- 11 TSX PCX 1031: universal connecting cable between a PC compatible (COM port, 9-way SUB D connector) and the TER or AUX port for TSX Micro/Premium PLCs or the **TSX PACC 01** connection box (8-way mini-DIN connector). TSX CUSB 485 + TSX CRJDB 25: USB to RS 485 converter and Uni-Telway cordset between a PC compatible (USB port) and the **TSX SCA 62** subscriber socket.
- 12 TSX CSC 015: connecting cordset between the TSX<sup>™</sup> 17 micro-PLC (via a TSX 17 ACC5 adapter or a TSX SCG 1161 module) and tha **TSX SCA 62** subscriber socket.
- 13 VW3 A8 306 2: connecting cordset (length 3 m) between the Altivar® 61/71 speed drive and the TSX SCA 62 subscriber socket.

(1) With TSX 37 21/22 PLCs.

### Presentation, description, characteristics

# Modicon<sup>®</sup> Premium<sup>™</sup> automation platform

Asynchronous serial links

TSX Micro

### Presentation

TSX Micro<sup>™</sup> and Premium<sup>™</sup> PLCs provide, via their processor, coprocessor or TSX<sup>™</sup> SCY 21601 communication module, several possible ways for exchanging data in character mode with devices equipped with an asynchronous serial link interface:

RS 485 integrated port.

■ Type III PCMCIA card with RS 232, RS 485 (RS 422 compatible) or 20 mA current loop link

Protocols supported are character mode (ASCII), Uni-Telway<sup>™</sup> and Modbus<sup>®</sup>. Other protocols are also available, or can be developed on request, on a RS 485 or RS 232 link, which enables TSX Micro/Premium PLCs to communicate on third-party architectures. The list of modules available can be obtained from your Schneider Electric Regional Sales Office, or from our Internet site www.collaborativeautomation.com.

#### Description

#### Integrated links

1 Via integrated port on the processor or slot-PLC:

The AUX (1) port (8-way mini-DIN connector) has one non-isolated RS 485 serial link channel (maximum distance 10 m).

2 Via integrated port on the TSX SCY 21601 module:

This module for Premium PLCs has one isolated RS 485 serial link channel (25-way SUB-D connector). Half duplex multiprotocol, including Uni-Telway.

#### TSX<sup>™</sup> SCP 11• multiprotocol PCMCIA cards

- 3 A slot on the processor, coprocessor and on the TSX SCY 21601 module takes cards which are comprised of:
- A removable cover with fixing screws for access to the 20-way miniature connector.
- Two indicator lamps: 5
- ERR lamp: detected card or link fault,
- COM lamp: data transmission or reception.
- To be ordered separately: TSX SCP Co oo cable.

#### (1) TER port for TSX Micro TSX 37 05/08/10 PLC.

	Integrated channel (channel 0) TSX SCY 21601 module	RS 485/RS 422 device (3) via TSX SCA 50 box	3 m	TSX <sup>™</sup> SCY CU 6030	0.180
Universal cable for terminal port/RS 232	integrated port	RS 232 of a terminal device (DTE) (4)	2.5 m	TSX <sup>™</sup> PCX 1031	0.170
device	(TER or AUX) TSX P ACC 01 box	USB port of PC (USB/RS 485 converter)	0.4 m	TSX <sup>™</sup> CUSB 485 (5)	0.144
		USB port (mini-DIN/RJ45 cordset	2.5 m	TSX <sup>™</sup> CRJMD 25 (5)	0.150
Cables for RS 232 connection	TSX SCP 111 card	Communication device: modem, converter, (DCE) (3)	3 m	TSX SCP CC 1030	0.190
		Point-to-point terminal device	3 m	TSX SCP CD 1030	0.190
		(DTE) (3)	10 m	TSX SCP CD 1100	0.620
Cable for BC 20 mA connection	TSX SCP 112 card	Current loop device (2)	3 m	TSX SCP CX 2030	0.160

PCMCIA type III slot can receive one TSX SCP 111/112/114 or TSX FPP 20 card.
 End of cable with flying leads.
 End of cable fitted with a 25-way male SUB-D connector.
 End of cable fitted with a 9-way male SUB-D connector. For use, to order separatly one TSX CTC 10 adaptator (9-way

male SUB-D connector/25-way male SUB-D connectors). (5) With TSX CUSB 485 converter, use the TSX CRJMD 25 cordset (equipped with 1 x mini-DIN and 1 x RJ45).

### Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Unity<sup>™</sup> Pro software

User interface

#### **User interface**

The Unity<sup>™</sup> Pro welcome screen provides access to all available tools in a userfriendly format that has been redesigned on the basis of feedback received from users of Concept<sup>™</sup> and PL7<sup>™</sup> Junior/Pro application design software.

This welcome screen consists of a general view made up of a number of windows and toolbars, which can be arranged as required on the screen:

- Menu bar from which all functions can be accessed
- 2 Toolbar consisting of icons from which the most frequently used functions can be accessed
- 3 Application browser, which can be used to browse the application based on a conventional and/or a functional view
- 4 Editor windows area, which can be used to view a number of editors at the same time (configuration editor, Structured Text/Ladder etc. language editors, data editor)
- 5 Tabs for direct access to editor windows
- 6 Information window with tabs (User Errors, Import/Export, Search/Replace, etc.)
- 7 Status bar

#### Accessing functions

All functions can be accessed via drop-down menus from the menu bar. The toolbar, which consists of icons, provides faster access to the most frequently used functions. This toolbar, which is displayed by default, can be customized to meet the requirements associated with the various uses of Unity Pro software and is divided into three groups:

- Main toolbars, which are always displayed
- Contextual toolbar, which is displayed when the corresponding editor is selected
- Toolbar with zoom functions (in and out), full-screen view for editor window

They are classified according to the category of functions available:

- File management (New Project, Open, Save, Print)
- Edit (Undo, Redo, Confirm, Go To)

■ Application services (Analyse Project, Build Project, Browse, Find,

- Access Library)
- Automation platform operating mode (Upload/Download Project,
- Online/Offline, Run/Stop, Animate, PLC/Simulation Mode)
- Debug mode (Set/Remove Breakpoint, etc.)
- Window display (Cascade, Horizontal, Vertical)
- Online help (non-contextual or contextual)

6

Toolbar with zoom (in and out)

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform

Unity<sup>™</sup> Pro software

Project navigator

### **Project navigator**

- The project browser can be used:
- To display the content of a Modicon<sup>®</sup> Premium<sup>™</sup>, Quantum<sup>™</sup> or M340<sup>™</sup> PLC project
   To move between the different components of the application (configuration,
- program, variables, communication, DFB user function blocks, DDT derived function blocks) created by the user

■ Structural view, which provides an overall view of the various components of the application. This representation provides a view of the order in which the program sections are processed in the PLC.

■ Functional view, which provides a view of the project based on specific function modules. This representation provides a breakdown according to consistent functions in relation to the process to be controlled. These two view types, which are available at any time, can be displayed separately or at the same time (with horizontal or vertical windows) by clicking on the icons on the toolbar.

### Structural view

E

-

This conventional view allows you to access the different components of the application (configuration, programming, function blocks, debugging, etc.) via the application browser.

The browser gives an overall view of the program and offers fast access to application components.

- 1 Configuration editor
- 2 DFB (user function block) and DDT (Derived Data Type) editors
- 3 Communication networks editor
- 4 Program editor
- 5 Variables editor
- 6 Animation tables editor
- 7 Runtime screens editor
- 8 Documentation editor

From any level in the tree structure, you can:

9 Create a hyperlink to a comment or description

**10** Create a directory for storing hyperlinks used to access a set of user folders From this level, it is also possible to zoom in and only view the details for a component on this level.

### **Functional view**

Unity<sup>™</sup> Pro software applications support the creation of an application structure for Modicon M340, Premium, and Quantum platforms based on function modules comprising:

- Sections (program code)
- Animation tables
- Runtime screens

The designer can define a multi-level tree structure for the application, independently of the multi-task structure of the PLC.

Program sections written in Ladder (LD), Structured Text (ST), Instruction List (IL), Function Block Diagram (FBD), or Sequential Function Chart (SFC) language can be associated with each level, along with animation tables and runtime screens

### Exporting/importing function modules

The tree structure, or a portion of it, can be exported to functional modules. In this case, program sections on the various module levels are exported.

Utilities make it easy to reuse these modules in new applications by means of data and module name reassignment services.

6/7

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Unity<sup>™</sup> Pro software

Configuration editor

**Configuration editor** 

### Hardware configuration

The first step when creating an automation project based on a Modicon® Premium™, M340<sup>™</sup> or Quantum<sup>™</sup> platform is to select the processor for which a rack and power supply are defined by default.

The configuration editor supports the intuitive and graphics-based modification and extension of this configuration with the following elements:

- Racks, power supply
- PCMCIA memory or communication cards (Premium) on the processor
- Discrete I/O, analog I/O, or application-specific modules

### Hardware configuration

### 2.2 : 140 EHC 202 00 - m x I SPEED ONT 20 INPUT START ADDRE INPUT END ADDRESS RT ADDRES ADDRESS 11. WEIGHING 3 FILTERS TSKISP MR 🖃 Task: FAST • \* \* 7 M

### I/O module parameter setting

# 1.02 14 C. Contened & Cont

"Communication" folder with 2 networks declared

### Configuration and parameter settings for I/O and application-specific modules

From the configuration screen for Modicon Premium, M340 or Quantum racks, the parameters screen displayed for a specific module can be used to define the operating characteristics and parameters for the selected application, for example: Filter values for discrete I/O

- Voltage or current range for analog I/O
- Threshold counter values
- Trajectory of axes for position control
- Weigher calibration for weighing
- Transmission speed for communication
- Pre-symbolization for variables associated with modules

### Configuration and parameter settings for communication networks

The "Communication" folder in the structural view can be used to define the list of networks connected to the PLC station. Then, the parameters for elements required for networks to function correctly can be set by:

- Creating a logical network to which comments can be associated
- Configuring a logical network defining the various associated network services Once the network module has been created in the configuration, it must then be associated with one of the logical networks.

Ethernet Modbus<sup>®</sup>/TCP, Modbus Plus<sup>™</sup>, and Fipway<sup>®</sup> network modules are configured in this way.

### Setup (continued)

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Unity<sup>™</sup> Pro software

Configuration editor

### Configuration editor (continued)

### **Configuration check**

- The following information can be accessed at any time during configuration: ■ The power consumption statistics for the power supply in each of the racks in the PLC configuration, for the different voltages provided by each of these power supplies
- The number of inputs/outputs configured (with Modicon® Premium<sup>™</sup>, Quantum<sup>™</sup> or M340<sup>™</sup> platform)

Power supply requirements analysis

**Configuration of CANopen devices** 

In the same way as for in-rack modules, the configuration of devices on CANopen through a Modicon M340 processor is fully integrated into the configuration editor.

Graphical configuration of devices on CANopen bus

### "Data & Languages" tab in the workstation options

### Workstation and project configuration

Unity<sup>™</sup> Pro can be used to configure both the working environment (workstation options) and the content of the project itself.

It is also possible to configure the toolbars and to run third-party applications from Unity Pro.

In addition, users can choose the working language from the list of languages selected when the software was installed.

### Workstation options

The workstation options cover the characteristics specific to a given workstation. They are applied when Unity Pro is used to develop any project on that station. The following elements can be configured:

The way information is edited and presented in the project being developed (for example: whether or not coils are positioned in the last column of the editor, or the position of the cursor after confirmation of the information entered)

■ The application conversion strategy from PL7<sup>™</sup>, Concept<sup>™</sup> IEC, and LL984 language

The function library path

■ The opening mode for Unity Pro: either programming or run mode

## Setup (continued)

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Unity<sup>™</sup> Pro software

Workstation and project configuration

### Workstation and project configuration (continued)

### **Project options**

In contrast to the workstation options, project options cover characteristics that have a direct impact on the programming and execution capacities offered by the program in the PLC. They are saved in the application, and consequently, are attached to the project. They can be modified during the course of the project.

Project option configuration is comprised of the following elements:

- Project generation with the information enabling the project to be retrieved on a new terminal
- Use of diagnostic functions and language for messages
- Warnings generated during project analysis: overlapping of addresses, unused variables, etc.

■ Language extension: If none of the boxes is checked, the program is strictly compliant with IEC 61131-3. Extensions are possible in the five Unity<sup>™</sup> Pro languages.

Access management to runtime screens in online mode.

"Language extensions" tab in the workstation option

#### Other possible options

Users can create their own toolbars by reusing the default icons provided on the toolbars.

User-created toolbar containing the debugging tools

Menu for adding and deleting tool access from Unity Pro

It is also possible to enhance the main Unity Pro menu bar by adding direct links to other software tools.

A utility in the Unity Pro program group can be used to change the working language. The change will take effect the next time the software is launched. Six languages are available: English, German, Spanish, French, Italian, and Chinese.

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Unity<sup>™</sup> Pro software

Application structure

### Software structure

The Modicon<sup>®</sup> Premium<sup>™</sup>, M340<sup>™</sup> and Quantum<sup>™</sup> platforms implemented by Unity<sup>™</sup> Pro software support two types of application structure:

■ Single-task: This is the more simple default structure, in which only the master task is executed.

■ Multi-task: This structure is more suitable for high-performance real-time events and consists of a master task, a fast task, periodic tasks, and high-priority event-triggered tasks.

The master, fast, and periodic tasks are made up of sections and subroutines. These sections and subroutines can be programmed in any of the following languages: Structured Text (ST), Instruction List (IL), Ladder (LD) or Function Block Diagram (FBD). The event-triggered tasks use the same languages. Sequential Function Chart (SFC) or Grafcet<sup>™</sup> language is reserved for master task sections.

The table below lists the possible program tasks for Modicon M340, Premium<sup>™</sup> and Quantum type processors, respectively.

Platform	Modicon <sup>®</sup> M34	D™	Premium™			Quantum™	
	BMX P34 1000	BMX P34 20•0	TSX <sup>™</sup> P 57 0244M TSX P 57 1●4M	TSX P 57 2•(3)4M TSX P 57 3•(3)4M TSX P 57 4•(3)4M	TSX P 57 554M TSX P 57 5634M TSX P 57 6634M	140 CPU 31110 140 CPU 434 12U	140 CPU 651 ●0 140 CPU 671 60

From timers	32	64	-	-	32	16	32
Total	32	64	32	64	128	64	128

Master task

Fast task

### Structure, modular, and portable programming

The tasks of a Unity<sup>™</sup> Pro program for Modicon<sup>®</sup> M340<sup>™</sup>, Premium<sup>™</sup>, or Quantum<sup>™</sup> platforms are composed of several parts called sections and subroutines. Each of these sections can be programmed in the most appropriate language for the process to be executed.

Such division into sections enables a structured program to be created and program modules to be generated or added with ease.

Subroutines can be called from any section of the task to which they belong or from other subroutines in the same task.

**Compatibility of languages compliant with IEC standard 61131-3**: Unity Pro software can be configured (*Tools/Project Settings/Language Extensions menu*) to help ensure that applications generated are compliant with IEC standard 61131-3. Furthermore, as long as you use only the standard instruction libraries, you will be able to reuse programs created in this way on any Modicon M340, Premium or Quantum platform.

### Software structure (continued)

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform

Unity<sup>™</sup> Pro software Single-task / Multi-task structure

Cyclic execution

Periodic execution

### Single-task software structure

- Two types of cyclic execution are supported:
- Normal cyclic execution. This is the default option.

■ Periodic execution. This type of execution, as well as the period, are selected by the user during programming when the task parameters are set (Mast task).

### Normal execution (cyclic)

At the end of each scan, the PLC system launches a new scan. The execution time of each scan is monitored by a software watchdog whose value is defined by the user (1,500 ms, maximum).

In the event of an overrun, a detected fault will cause:

- The scan to stop immediately (STOP)
- Status to be displayed on the front panel of the processor
- The alarm relay for the main rack power supply to be set to 0

### **Periodic execution**

A new scan is executed at the end of each period. The execution time of the scan must be less than the time of the period defined (255 ms, maximum). In the event of an overrun, the latter is stored in a system bit (%S19), which can be reset to 0 by the user (via the program or terminal).

A software watchdog, which can be configured by the user (1,500 ms, maximum), monitors the scan time. In the event of an overrun, a detected execution fault is indicated (see Normal execution). The scan execution times (the last scan, the longest scan, and the shortest scan) are stored in system words %SW 30/31/32.

### Multi-task software structure

Modicon<sup>®</sup> Premium<sup>™</sup>, M340<sup>™</sup> and Quantum<sup>™</sup> platforms support a multi-task structure comprised of:

 1 master task (divided into several sections programmed in ST, IL, LD, FBD, and SFC languages)

- 1 fast task (divided into sections)
- 0 to 4 auxiliary tasks (divided into sections) (1).

■ 1 or more event-triggered tasks (only one section per task). These tasks are independent and executed in parallel, with the PLC processor managing their execution priority. When an event occurs, or at the start of the fast task scan:

- If any lower-priority tasks are currently being executed, they are suspended.
- The event-triggered task or fast task is executed.

■ The interrupted task resumes once execution of the priority task has been completed.

Event-triggered tasks	Fast task	Master task	Auxiliary tasks (1)
Timer_1	Airlock_Alarm (IL)	Airlock (LD) Mast	Aux1 Process value
EVT1	Mon_Dry (LD)	Oven_1 (SFC)	(FBD)
EVT0 Outside limits	Oven_Alarm (ST)	Tunnel_1 (SFC)	Oven Diag (ST) Temp. (FBD)
	Cleaning_Alarm (ST)	Extractor (FBD)	SRO
Priority +		Drying (LD)	
-			

This structure optimizes the way processing power is employed and can be used to structure the application and simplify design and debugging, as each task can be written and debugged independently of the others.

(1) Tasks reserved for Premium TSX P57 5•4M/6634M and Quantum 140 CPU 651 •0/67160 high-end processors.

## Software structure (continued) Modicon<sup>®</sup> Premium<sup>™</sup>

### Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Unity<sup>™</sup> Pro software

Multi-task structure

Application browser

Program execution

### Multi-task software structure (continued) Master task

### ister lask

This task, which can be periodic or cyclic, executes the main program. It is activated systematically.

Each of its component sections and subroutines can be programmed in Ladder (LD), Function Block Diagram (FBD), Structured Text (ST), or Instruction List (IL) language. Several sections of the master task can be programmed in Sequential Function Chart (SFC) or Grafcet language.

### Fast task

This task, which has a higher priority than the master task, is periodic in order to allow time for tasks with lower priorities to be executed. It should be used when fast periodic changes in discrete inputs need to be monitored and taken into account. The execution of the master task (lower priority) is suspended while the fast task is being executed. Processing operations in this task must be as short as possible in order to avoid adversely affecting master task processing operations. Each section and subroutine of the fast task can be programmed in Instruction List, Structured Text, Ladder, or Function Block Diagram language (IL, ST, LD, or FBD).

### Auxiliary tasks

These tasks, which are available with the Premium<sup>™</sup> and Quantum<sup>™</sup> TSX<sup>™</sup> P57 5●4M/6634M and 140 CPU 651 ●0/652 60/671 60 high-end processors are intended for slower processing operations, such as measurement, process control, HMI, application diagnostics, etc.

Periodic type auxiliary tasks have the lowest priority and are executed once the higher-priority periodic tasks (master and fast) have completed their scan. Each subroutine or section of an auxiliary task can be programmed in Instruction List, Structured Text, Ladder, or Function Block Diagram language (IL, ST, LD, or FBD).

### Event-triggered tasks

Unlike the tasks described above, these tasks are not linked to one period. The asynchronous execution of these tasks is triggered by:

An event from certain application-specific modules (for example: overrun of a counter threshold, change of state of a discrete input)

An event from the event timers.

These tasks are processed with priority over other tasks and are thus suitable for processing requiring very short response times in comparison to the arrival of the event.

Modicon<sup>®</sup> Premium<sup>™</sup>, M340<sup>™</sup> and Quantum<sup>™</sup> platforms have 3 priority levels (these are, in descending order, EVT0 module event, EVTi module events, and Timeri timer events).

These tasks, each comprising a single section, can be programmed in Instruction List, Structured Text, Ladder, or Function Block Diagram language (IL, ST, LD or FBD).

### Assignment of I/O channels to tasks

The master, fast, and event-triggered tasks read (at the start of the scan) and write to (at the end of the scan) the inputs/outputs assigned to them.By default, they are assigned to the master task.

For the Quantum platform, the remote inputs/outputs (RIO) are assigned only to the master task (these assignments can be made per station or for each of the component sections of the task); the distributed inputs/outputs (DIO) are assigned to the master task (with no assignment to its component task).

For event-triggered tasks, it is possible to assign input/output channels (1) other than those relating to the event. Exchanges are then performed implicitly at the start of processing for inputs and at the end of processing for outputs.

(1) These channel assignments are made per I/O modules for Quantum and per channel for Premium inputs/outputs.

IEC languages

### Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Unity<sup>™</sup> Pro software

Graphical / Textual languages

### Five IEC languages available

The five graphical or textual languages available in Unity<sup>™</sup> Pro software are used for programming Modicon<sup>®</sup> Premium<sup>™</sup>, M340<sup>™</sup> and Quantum<sup>™</sup> automation platforms.

The 3 graphical languages are:

- Ladder (LD)
- Function Block Diagram (FBD)
- Sequential Function Chart (SFC) or Grafcet<sup>™</sup>

The 2 textual languages are:

- Structured Text (ST)
- Instruction List (IL)

For these 5 languages, you can use the standard set of instructions compliant with IEC standard 61131-3 to create applications that can be transferred from one platform to another. Unity<sup>™</sup> Pro software also provides extensions to this standard set of instructions. As they are specific to Modicon M340, Premium, and Quantum PLCs, these extensions support the development of more complex applications in order to maximize the potential of the specific features of each of these platforms.

#### Functionalities common to the five language editors

The editors for each of the 5 languages provide a number of common tools used for writing, reading, and analyzing programs in a user-friendly manner:

■ The text editors for Instruction List (IL) and Structured Text (ST) languages feature:

□ Text entry in insert or overwrite mode

□ The use of dialog boxes for the assisted entry of variables, functions, function blocks, or assignment instructions

□ Checks on data entry to detect syntax or semantics errors. The results of these checks are indicated by red "wavy" underlining or by a change in the color of the text containing the detected error.

□ A set of colors, which facilitates reading by distinguishing text (black) from operators (red), language key words (blue), and program comments (green)

■ The graphics editors for Ladder (LD), Function Block Diagram (FBD), and Sequential Function Chart (SFC) languages feature:

□ A set of graphics elements for direct access to the various graphic symbols in the language via the mouse or keyboard

□ A pop-up menu, which can be accessed simply by right-clicking the mouse

Unlimited number and length of comments. These comments can be positioned as text objects in any cell (graphical languages) or at any point in expressions (textual languages).

Assisted data entry functions via:

Access to DFB function libraries, to the variable selector, and to the text object for entering comments

- □ Initialisation of a variable reference
- $\hfill\square$  Initialisation of the animation table on selected variables
- Display and modification of the properties of the selected variable
- $\hfill\square$  Creation of variables in real time without having to use the data editor
- "Cut", "Copy", "Paste", "Delete", "Move", etc.
- The use of bookmarks on lines of text or in the margin so that you can:
- □ Easily locate lines in important program sections
- Browse in an editor by bookmark, label, or line and column number

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Unity<sup>™</sup> Pro software

Ladder language

### Ladder (LD) language

Each section or subroutine using Ladder language consists of a series of rungs executed sequentially by the PLC. Each rung consists of graphic objects (placed in cells arranged in columns and lines) corresponding to contacts, links, coils, operation blocks, EF/EFB/DFB function blocks, jumps, sub-routine calls, etc.

### Program structure (section or subroutine)

- Each Ladder language section can contain:
- Between 11 and 64 columns (number set by user)
- Up to 2,000 lines (for the rungs in the section)

Graphics palette in the Ladder language editor

"Mixed Display" mode supports the unrestricted display of comments, addresses, and symbols for the variables used for rungs.

## IEC Languages (continued)

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Unity<sup>™</sup> Pro software

Function Block Diagram language

### Function Block Diagram (FBD) language

Function Block Diagram language is a graphical language based on function blocks associated with variables or parameters, which are linked together. This language is particularly well suited for process control applications.

### Program structure (section or subroutine)

The FBD graphical language three types of function block:

Elementary blocks (EFs)

×

Elementary Function Blocks (EFBs), sorted into different libraries depending on their type of use

■ Derived Function Blocks (DFBs), which have a structure identical to that of EFBs but are created by the user with the ST, IL, LD, or FBD programming languages

Within the same section, subroutines can be called using a specific block. Program jumps to a block instance can also be programmed.

A section programmed in FBD language contains the equivalent of a grid with 30 columns and 23 rows. This can be extended to a wider page.

SFC charts

Step properties

### Sequential Function Chart (SFC)<sup>™</sup> and Grafcet<sup>™</sup> language

Sequential Function Chart (and Grafcet) language can be used to describe the sequential part of an automation system in simple graphical format using steps and transitions.

SFC<sup>™</sup> language does not process charts in the same way as Grafcet<sup>™</sup> language: ■ SFC only authorizes one token in a single chart.

■ Grafcet language authorizes several tokens in a single chart.

Unity<sup>™</sup> Pro software has one single editor for both of these languages with the option of defining behaviour in the application settings (*Tools/Project Settings/Language extensions menu*).

### Program structure (master task section)

SFC language is only used in sections belonging to the master task. Each SFC section consists of a main chart sub-section (CHART) and sub-sections for each of the macro-steps. Charts consist of:

- Macro-steps, which are the unique representation of a set of steps and transitions (used to set up a hierarchical chart structure)
- Steps
- Transitions and directed links between steps and transitions
- Associated with steps and transitions, respectively, the actions and transition conditions can be:
- Integrated into the CHART or macro-step charts where the actions or transition conditions are defined by a single variable
- Processed in specific sections, in which case dedicated processing (to be

programmed in Ladder, Function Block Diagram, Structured Text or Instruction List language) is necessary

In order to check that machine scans have been completed successfully, activity times (minimum, maximum) can be associated with each step. These times are set by the user.

## Program structure (section in master task)

For each SFC section, the graphics editor provides a maximum of:

- One grid containing 32 columns and 200 rows, or 6,400 cells. Steps, transitions, or jumps all need one cell, respectively.
- 1,024 steps (macro-steps and steps in macro-steps)
- 20 actions assigned to the same step
- 100 steps activated at the same time
- 100 actions activated at the same time

To help you to create basic charts, graphic screens can be used to create "n" steps in series and "m" steps in parallel in a single operation.

Dialog boxes can be used to assign associated properties to steps (activity time, actions), transitions (variable linked to transition condition), etc.

## IEC Languages (continued)

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Unity<sup>™</sup> Pro software

Structured Text language

### Structured Text (ST) language

Structured Text language is a sophisticated, algorithmic type language particularly well suited for programming complex arithmetic functions, table operations, message handling, etc.

### Program structure (section or subroutine)

Structured Text language can be used to directly transcribe an analysis based on an organisation chart, is structured into expressions composed of a series of instructions organized in lines.

There is no limit to the number of characters an instruction line may contain (the only limit is the program memory available for the Modicon® Premium<sup>™</sup>, Quantum<sup>™</sup> and M340<sup>™</sup> platforms, except on TSX<sup>™</sup> P57 10 to 40 processors, where the limit is 64 kbytes). The length of the section is only limited by the size of the application memory.

Four preformatted expression structures can be called up directly from the toolbar:

■ Conditional action: IF...THEN...ELSIF...THEN...ELSE...END-IF ■ Iterative conditional action: WHILE...DO...END\_WHILE;

- REPEAT...UNTIL...END\_REPEAT
- Repetitive action: FOR...TO...BY...DO...END\_FOR
- Selective action: CASE...OF...ELSE...END\_CASE
- The operands used in the expressions are bit variables, word variables, or variables linked to function blocks.

To make the expressions easier to read, different colors are used to identify objects, language key words, and program comments.

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Unity<sup>™</sup> Pro software

Instruction List language

### Instruction List (IL) language

Instruction List language represents the equivalent of a Ladder diagram in text form. It can be used to write Boolean and arithmetic equations using the functions available in the Unity<sup>™</sup> Pro language (calling of functions and function blocks, assignment of variables, creation of program jumps, branching to subroutines within a program section, etc.).

### **Program structure** (section or subroutine)

A program in Instruction List language is comprised of a sequence of instructions classified into the following different families:

- Bit instructions, for example, read input: *LD overspeed*
- Function block instructions, for example, call timer: CALL MOTOR\_TIMER
- Numerical instructions using single, double, and floating-point integers, for
- example, add: LD Result ADD Surplus ST Archive

■ Word table or character string instructions, for example, make assignment: *LD Result*:10:=Setpoint:10

■ Program instructions, for example, SR call: CALL SR10

The operands used in the expressions are bit variables, word variables, or variables linked to function blocks.

Data editor

### **Data editor**

The data editor can be accessed from the structural view of the project, providing a single tool for performing the following editing tasks:

- Declaration of data including variables and function blocks (declaration of their type, instances, and attributes)
- Use and archiving of function block data types in different libraries
- Hierarchical view of data structures
- Searching, sorting, and filtering of data
- Creation of a hyperlink in the comments of any variable to access a description

### The data are displayed on four tabs:

"Variables" tab for the creation and management of the following data instances: bits, words, double words, inputs/outputs, tables, and structures

- "DDT Types" tab for the creation of derived data types (tables and structures)
- "Function Blocks" tabs for the declaration of EFB and DFB function blocks
- "DFB Types" for the creation of DFB user function block data types

Each data element has several attributes, including:

The name and type of the variable are mandatory

■ The comment, physical address in the memory, and initial values are optional

The data editor columns can be configured (number of columns, order). The attributes associated with a variable can be displayed in a properties window.

This editor can be accessed at any time during programming by selecting variables for data modification or creation.

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Unity<sup>™</sup> Pro software

DFB function blocks

### **DFB user function blocks**

With Unity<sup>™</sup> Pro software, users can create their own function blocks for specific application requirements on Modicon<sup>®</sup> Premium<sup>™</sup>, Quantum<sup>™</sup> and M340<sup>™</sup> platforms. Once created and saved in the library, these user function blocks can be reused as easily as EFBs (Elementary Function Blocks).

The user function blocks can be used to structure an application. They are used when a program sequence is repeated several times in the application or for fixing a standard programming routine. They can be read-only protected or read/write-protected. They can be exported to other Unity Pro applications.

- Using a DFB function block in one or more applications:
- Simplifies program design and entry
- Improves program readability and understanding

■ Facilitates program debugging (variables handled by the DFB block function are identified in the data editor)

Enables the use of private variables specific to the DFBs, which are independent of the application.

A DFB function block is set up in several phases:

The DFB is designed by assigning a name, a set of parameters (inputs, outputs,

public and private internal variables) and a comment to it via the data editor. ■ The code is created in one or more sections of the program, with the following languages selected according to requirements: Structured Text, Instruction List, Ladder, or Function Block Diagram (ST, IL, LD, or FBD).

■ The DFB may be stored in a library with an associated version number.

■ A DFB instance is created in the data editor or when the function is called in the program editor.

■ This instance is used in the program in the same way as an EFB (Elementary Function Block). (The instance can be created from within the program.)

### Main characteristics

Wall characteristics	
Inputs	32, maximum <i>(1)</i>
Outputs	32, maximum <i>(2)</i>
Inputs/outputs	32, maximum (1) (2)
Public internal variables	Unlimited (3), can be accessed via the application program
Private internal variables	Unlimited (3), cannot be accessed via the application program
Comments	1,024 characters, maximum
Program sections	Unlimited, each section can be programmed independently in one of the 4 languages (IL, ST, LD, and FBD).

(1) The maximum cumulative total of inputs and inputs/outputs is 32.

(2) The maximum cumulative total of outputs and inputs/outputs is 32.

(3) For Premium processors, see page 1/10: characteristics, memory capacity, maximum size of object areas, unlocated internal data, and DFB and EFB function blocks.

User-defined libraries

### **Function block libraries**

The function and function block libraries manager contains the elements provided with Unity<sup>™</sup> Pro software. The functions and function blocks are organized into libraries consisting of families. Depending on the type of PLC selected and the processor model, users will have a sub-set of these libraries available to write their applications. However, the "Base Lib" library contains a set of functions and function blocks that are compatible with the Modicon® Premium™, Quantum™ and M340" PLCs. In particular, it contains the blocks compliant with IEC 61131-3. The "Base Lib" library is structured into families:

- Timers and counters
- Process control on integers
- Array management
- Comparison
- Date and time management
- Logic processing
- Mathematical processing
- Statistical processing
- Character string processing
- Type-to-type data conversion

The "Base Lib" library, which covers standard automation functions, is supplemented by other, more application-specific libraries and platform-specific functions:

■ Communication library, providing an easy means of integrating communication programs from PLCs with those used by HMIs from the PLC application program. Like other function blocks, these EFBs can be used in all languages to exchange data among PLCs or to deliver data to be displayed on an HMI.

■ Process control library. The CONT\_CTL library can be used to set up processspecific control loops. It offers controller, derivative, and integral control functions, and additional algorithms such as: EFBs for calculating mean values, selecting a maximum value, detecting edges, or assigning a hysteresis to process values, etc.

Diagnostics library, used to monitor actuators and contains EFBs for active diagnostics, reactive diagnostics, interlocking diagnostics, permanent process condition diagnostics, dynamic diagnostics, monitoring of signal groups, etc. ■ I/O management library, providing services to handle information exchanged

with hardware modules (formatting data, scaling, etc.)

Motion Function Blocks library, containing a set of predefined functions and structures to manage motion controlled by drives and servo drives connected on CANopen

Motion library for motion control and fast counting

"System" library, providing EFBs for the execution of system functions, including: evaluation of scan time, availability of several different system clocks, SFC section monitoring, display of system state, management of files on the memory cartridge of the Modicon M340 processor, etc.

Finally, a library named "obsolete" containing function blocks used by legacy programming software needed to perform application conversions

#### Management of user standards

Users may create libraries and families in order to store their own DFB function blocks and DDT data structures. This enhancement allows users to take advantage of programming standards adapted to their needs, along with version management. This means that it is possible to:

Check the version of the elements used in an application program against those stored in the library

Perform an upgrade, if necessary

### **Debugging tools**

Unity<sup>™</sup> Pro software offers a complete set of tools for debugging Modicon<sup>®</sup> Premium<sup>™</sup>, M340<sup>™</sup> and Quantum<sup>™</sup> applications. A tool palette provides direct access to the main functions:

- Dynamic program animation
- Setting of watchpoints or breakpoints (not authorized in event-triggered tasks)
- Step-by-step program execution. A function in this mode enables section-by-

section execution. Instruction-by-instruction execution can be launched from the previous breakpoint. Three execution commands are therefore possible when the element to be executed is a subroutine (SR) or DFB user block instance: □ Detailed step-by-step, or "Step Into". This command is used to move to the first element of the SR or DFB.

Overall step-by-step, or "Step Over". This command is used to execute the entire SR or DFB.

□ Outgoing step-by-step, or "Step Out". This command is used to move to the next instruction after the SR or DFB element.

 Independent execution of the master (MAST), fast (FAST), auxiliary (AUX), and event-triggered (EVTi) tasks

### Animation of program elements

Dynamic animation is managed by program section. A button on the toolbar is used to activate or deactivate animation for each section.

- When the PLC is in RUN, this mode can be used to view, simultaneously:
- The animation of a program section, regardless of the language used

The variables window containing the application objects created automatically from the section viewed

■ Several windows can be displayed and animated simultaneously. The "Tool tip" function, which uses help balloons, can be used to view a variable or its content simultaneously when the object is selected with the mouse (or other pointing device). Users can add inspection windows to display program variables.

Two types of animation are supported:

■ Standard: The variables of the active section are refreshed at the end of the master task (MAST).

Synchronized: The watchpoint can be used to synchronize the display of animated variables with a program element in order to determine their value at that precise point in the program.

### Animation table

Tables containing the variables of the application to be monitored or modified can be created by data entry or initialized automatically from the selected program section.

In addition to data animation it is possible to:

- Modify bit variables or force them to 0 or 1
- Change the display format
- Copy or move variables
- Search by cross-reference
- Display the list of forced bits

These tables can be stored in the application and retrieved from there at a later time.

### Debugging of DFB user function blocks

The parameters and public variables of these blocks are displayed and animated in real time using animation tables, with the option of modifying and forcing the required objects.

In exactly the same way as with other program elements, the watchpoint, breakpoint, step-by-step execution, and program code diagnostics functions can be used to analyze the behaviour of DFBs. Setting a breakpoint in a DFB user function block instance stops the execution of the task containing this block.

6/23

### Functions (continued)

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform

Unity<sup>™</sup> Pro software Debugging / PLC Simulation / Documentation

SFC control panel

PLC Simulator Panel

Simulator control panel

6

Access to documentation editor

### Debugging tools (continued)

### Debugging in Sequential Function Chart (SFC)<sup>™</sup> language

The various debugging tools are also available in SFC<sup>™</sup> language. However, unlike other sections (IL, ST, LD, or FBD) an SFC section executed step-by-step does not stop execution of the task but instead freezes the SFC chart. Several breakpoints can be declared simultaneously within a single SFC section.

Numerous commands are available in this debugging mode via the control panel:

- Deactivate active step(s)
- Activate initial step(s)
- Disable step execution times Freeze chart regardless of transition conditions
- Stop processing of steps
- Move to the next step taking account of the transition conditions
- Enable transition and move to next step(s) (detailed step-by-step command: "Step Into")
- Enable transition in order to execute the end of the macro-step (outgoing)
- step-by-step command: "Step Out")
- Pre-position chart on steps for which markers have been set, etc.

### **PLC simulator**

The simulator integrated into Unity<sup>™</sup> Pro can be used to test the application program for Modicon<sup>®</sup> Premium<sup>™</sup>, Quantum<sup>™</sup> and M340<sup>™</sup> PLCs from the PC terminal without having to connect to the PLC processor. The functions provided by the debugging tools are available for debugging the master, fast, and auxiliary tasks. Because the simulator does not manage the PLC I/O, animation tables can be used

to simulate the state of inputs by forcing them to 0 or 1.

The simulator can be connected to third-party applications via an OPC server with OFS (OPC Factory Server<sup>™</sup>) software.

### **Documentation editor**

The documentation editor is based on the Documentation Browser, which shows the file structure in tree form.

It allows all or part of the application file to be printed on any graphics printer accessible under Windows and using True Type technology, in A4 or US letterprint format

The documentation editor supports the creation of user-specific files using the following headings:

- Title page
- Contents
- General information
- Footer
- Configuration
- EF, EFB, and DFB type function blocks
- User variables
- Communication
- Project structure
- Program
- Animation tables and cross references
- Runtime screens

The documentation editor can generate the documentation file based on two different structures:

Structural view: The objects in the project are associated with their corresponding headings

■ Functional view: The objects in the project are associated with the function modules to which they belong.

The documentation file can be created and saved as the project progresses, from one Unity<sup>™</sup> Pro session to another.

## Presentation, **Functions**

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Unity<sup>™</sup> Pro software

Diagnostics

## Functions (continued)

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Unity<sup>™</sup> Pro software

Diagnostics

### Functions (continued)

### **Application diagnostics**

Unity<sup>™</sup> Pro software features a library of function blocks for monitoring, called diagnostic DFBs and EFBs. The library of diagnostic function blocks is comprised of:

### Manufacturer blocks for system diagnostics

DIA input/output detected fault, which is used to monitor the I/O states □ ASI\_DIA, which monitors whether a detected error has occurred on the AS-i bus (module or bus detected fault, no slave, slave not configured or inoperative)

### Manufacturer blocks for application diagnostics

□ EV\_DIA, which monitors that an event (bit status) assumes the correct value at a specific time (no notion of timing)

□ MV\_DIA, D\_GRP, D\_REA, which monitor whether an event (change of bit status) occurs according to predefined time conditions

□ ALRM DIA, which monitors the combination of the status of 2 bits □ NEPO\_DIA and TEPO\_DIA, which are used to check, control, and perform diagnostics on elements of the operative part consisting of a combination of 2 preactuators and 2 sensors

### Open diagnostic blocks

These blocks allow users to create their own diagnostic function blocks customized to their specific applications, thus supplementing the manufacturer DFBs and EFBs presented above. Open diagnostic blocks are created from 2 model blocks, which must be written in Ladder (LD) language, or in Structured Text (ST), Function Block Diagram (FBD), or Instruction List (IL).

### Diagnostics with detected fault cause analysis

In addition, when a detected fault occurs, Unity Pro analyzes the relevant program sections and displays the probable causes and sources of the detected fault in a second window.

Thus, the user or process operator is guided through the detected fault analysis process and will be able to reduce machine downtime as a result.

Furthermore, with the diagnostics viewer integrated into Unity Pro, the instruction or module that caused the detected fault can be accessed directly from the alarm displayed in the viewer display window (see page 6/25 of this catalog).

6

### Functions (continued)

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform

Unity<sup>™</sup> Pro software

Diagnostics viewers / Runtime screens

```
Viewer
```

### Functions (continued)

### **Diagnostics viewers**

The diagnostic events processed by the Modicon<sup>®</sup> Premium<sup>™</sup>, Quantum<sup>™</sup> and M340<sup>™</sup> platforms via diagnostic DFBs/EFBs are stored in a buffer (specific data memory area of the PLC). The information contained in this buffer is sent (transparently for the user) to viewers for automatic display and for management of detected faults and alarms. The view function is supplied as a standard component for: Vijeo Designer<sup>™</sup> configuration software

- Unity<sup>™</sup> Pro programming software
- Magelis<sup>®</sup> XBT GT and Magelis<sup>®</sup> iPC graphic display terminals

The viewer integrated into Unity Pro can also be used to access the instruction or module that is the source of the detected fault. See "Diagnostics with detected fault case analysis" on page 6/26.

The Modicon M340, Premium, and Quantum platforms have multiviewer capability (and can be connected to up to 15 viewers). A PC-compatible station with the viewer function can have multi-PLC capability (and can be connected to up to 15 Modicon M340/Premium/Quantum platforms).

The buffer/viewer structure supports:

- A single point for detected fault management in each application
- Time-stamping of the occurrence of detected faults at the source
- Storage of intermittent detected faults in memory
- Independence with regard to the viewer functionality. The frame sent from the PLC buffer is identical for each viewer.
- Automatic archiving of error messages

### **Display window**

The diagnostics viewer takes the form of a display window divided into 2 sections: A message list area containing, for each alarm: state, DFB type, geographical zone, dates and times of appearance/disappearance, associated message, and status

■ An area for additional information about the selected message: type, comments, date of appearance, specific data, variables in error state, etc.

### **Runtime screens**

The runtime screens tool is integrated into Unity<sup>™</sup> Pro software. Runtime screens are designed to facilitate the running of automated processes during debugging, startup, and maintenance. Runtime screens provide a range of information (explanatory texts, display of dynamic values, control buttons, and views), enabling users to act quickly and easily to modify and dynamically monitor PLC variables.

The runtime screens editor provides the HMI (*Human/Machine Interface*) elements needed for the animated design and viewing of processes. It enables these screens to be designed using specific tools:

- Screen: creation of runtime screens, which can be classified according to family
   Message: creation of messages to be displayed
- Objects: creation of a graphic objects libraries based on:

□ Geometrical elements (line, rectangle, ellipse, incorporation of images, controller front panels, etc.)

Control elements (buttons, data entry fields, screen browsing controls, etc.)
 Animation elements (colors, flashing elements, bar graphs, etc)

When the station on which Unit Pro has been installed is connected to the PLC, users can obtain a dynamic screen display based on the process state. Depending on the assigned priority, screens can be sequenced via a keyboard command or a PLC request.

In online mode, the Unity Pro application program can be accessed directly via the runtime screens simply by clicking the selected object in a screen view. It is also possible to activate the animation-table or cross-reference functions after selecting one or more variables on the screen. To make the display easier to read, the views can be displayed in full screen mode. Because it is possible to create or modify a runtime screen when the PLC is in Run mode, this service increases productivity during installation and maintenance phases.

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform

Unity<sup>™</sup> Pro software PLC RUN / Cross-references / Import/Export

### Modifying the program with the PLC in RUN mode

With Unity<sup>™</sup> Pro, changes can be made to the program when the PLC connected to the programming terminal is in RUN mode. These modifications are performed with the following operations:

■ The application contained in the PLC is transferred to the PC terminal running Unity Pro, if necessary.

■ Program changes are prepared. These program modifications can be of any type and in any language (IL, ST, LD, FBD, and SFC), for example, addition or deletion of SFC steps or actions. The code of a DFB user function block can also be modified (however, modifications of its interface are not permitted).

These program changes are updated in the PLC (in RUN mode).

This function makes it possible to add or modify program code and data in different parts of the application in one single modification session (thus resulting in a unified, consistent modification with respect to the controlled process). This increased flexibility comes at a cost in terms of the amount of program memory required.

### **Cross-reference function**

The Unity<sup>™</sup> Pro cross reference function, which is available in standalone mode (offline) and when connected to the PLC in Run (online), allows users to view the elements of a PLC application when searching for any type of variable. This view indicates where the declared variable is used, as well as how it is used (for writing, reading, etc.).

This function also provides access to the Search/Replace function for variable names.

The variable search can be initialized from any editor (language, data, runtime screen, animation table, etc.).

### Import/export function

The import/export function available in Unity Pro supports the following operations from the structural and functional project views:

■ Via the import function, reuse in the current project up to 100% of a project created previously

■ Via the export function, copying up to 100% of the current project to a file for subsequent reuse

The files generated during export are generally in XML format (1). However, in addition to XML, variables can be exported and imported in the following formats:

- .xvm format compatible with OFS data server software
- Source format, in an .scy file compatible with the PL7 programming software
- Text format with separator (TAB) in a .txt file for compatibility with any other system

During an import, a wizard can be used to reassign data to new instances of:

- DFB function blocks
- DDT data structures
- Simple data

In addition, when a functional module is imported, the data associated with animation tables and runtime screens are also reassigned.

The XML import function also supports the transfer of a Modicon<sup>®</sup> Premium<sup>™</sup>, Quantum<sup>™</sup> or M340<sup>™</sup> PLC configuration prepared in the SIS Pro costing and configuration tool for use in the creation of a project in Unity Pro. This import function spares the user from having to redefine the PLC configuration when the PLC has already been configured with the SIS Pro tool.

6

<sup>(1)</sup> XML language: An open, text-based language that provides structural and semantic information.

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform

Unity<sup>™</sup> Pro software Application converters / System update utilities

### **Application converters**

Unity<sup>™</sup> Pro integrated conversion tools can be used to convert PLC applications created with Concept<sup>™</sup> and PL7<sup>™</sup> programming software to Unity Pro applications.

### Concept/Unity Pro converter (Modicon<sup>®</sup> Quantum<sup>™</sup> PLC)

This conversion is performed with a Concept application V2.5 or later (it can also be performed in V2.11 or later, but only after an update to V2.5). In order to perform the conversion, the application must be exported to an ASCII file in Concept. The export file is converted to a Unity Pro source file automatically. This source file is then analysed by Unity Pro. At the end of the procedure, a conversion report is generated, and an output window displays any conversion errors and provides direct access to the part of the program to be modified. The Concept application converter converts the application to Unity Pro, but does

not guarantee that it will operate correctly in real time. It is therefore essential to test or debug converted applications.

### PL7/Unity Pro converter (Modicon<sup>®</sup> Premium<sup>™</sup> PLC)

This conversion is performed with a PL7 application V4 or later (Premium PLC). In order to perform the conversion, the source file (complete application) or source file (user function block) must be exported in PL7.

The conversion procedure is similar to that of the Concept conversion described above.

**Note:** Applications created with Concept, Modsoft, and ProWorx can be converted to LL984. Please consult your Regional Sales Office.

### **Operating system update utilities**

The OS-Loader software designed for updating operating systems on Premium and Quantum platforms is supplied with Unity Pro software.

It is used to upgrade processors and modules in PL7 or Concept for compatibility with Unity Pro:

- Premium TSX<sup>™</sup> P57 2●3M/2623M and TSX P57 3●3M/3623M processors
- Quantum 140 CPU 434 12A and 140 CPU 534 14A processors (requires version PV 04 or later)
- Ethernet TSX<sup>™</sup> ETY ●102 and 140 NOE 771 ●1 communication modules
- EtherNet/IP TSX<sup>™</sup> ETC 100 and 140 NOC 77100 communication modules

These operating system updates are performed as follows for the various processor types:

- Uni-Telway<sup>™</sup> RS 485 terminal link for Premium processors
- Modbus<sup>®</sup> or Modbus Plus<sup>™</sup> terminal link for Quantum processors
- Ethernet Modbus/TCP network for integrated Ethernet port on Premium

processors and Ethernet Premium and Quantum modules(1) **Note:** For Modicon M340, this service is provided by Unity Loader.

(1) The operating system of the Quantum 140 CPU 671 60 processor is updated over an Ethernet network using its MT-RJ type fiber-optic connector (via a ConneXium transceiver or switch for a copper wire/fiber-optic interface). **Functions** 

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Unity<sup>™</sup> Pro XLS

### Unity<sup>™</sup> Pro XLS

In addition to the functions of Unity<sup>™</sup> Pro Extra Large, Unity<sup>™</sup> Pro XLS provides a set of function blocks of specific checks and protections to facilitate the creation and debugging of Modicon<sup>®</sup> Quantum<sup>™</sup> safety projects.

For a description of these characteristics and their setup, as well as the functional limitations provided for within the framework of SIL 2-certifiable safety projects according to IEC 61508, refer to the document entitled "*Quantum Safety PLC, Safety Reference Manual*" 11/2007, n° 3303879.00, approved by TÜV Rheinland and available at www.schneider-electric.com.

The Unity Pro XLS programming tool is certified compliant with the requirements of IEC 61508 for the management of safety applications with Quantum **140 CPU 651 60S/671 60S** PLCs.

It offers the complete range of functions required to program a safety project:

- In-depth detected error diagnostics
- Project protection

During project creation, it is the selection of the Quantum processor that determines whether or not the project created will be a safety project.

Unity Pro XLS is capable of processing any Unity Pro application type. No other programming tool is needed on the computer.

To program a safety project, Unity<sup>™</sup> Pro XLS provides two IEC 61131-3 programming languages:

- Function Block Diagram (FBD)
- Ladder language (LD)

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Unity<sup>™</sup> Pro XLS

### Unity<sup>™</sup> Pro XLS (continued)

### Safety program structure

A safety project must be programmed entirely in a master task (MAST).

It is not possible to:

- Program FAST, TIMER, INTERRUPT, or AUX tasks
- Use subroutines (SR sections)

#### Language elements

Unity<sup>™</sup> Pro XLS provides a set of specific, certified functions and function blocks. These are available in the "Unity Pro safety function block library".

Most of the language elements are available:

- □ Elementary data types (EDTs): BOOL, EBOOL, BYTE, WORD, DWORD, INT, UINT, DINT, UDINT, and TIME
- □ Simple arrays used exclusively for Ethernet Global Data communication
- □ Direct addressing, for example, writing %MW to memory via a coil in
- Ladder Logic (LD)
- Located variables

### Project checking options

Unity Pro XLS provides the following different options for the checks performed by the language analyser:

- □ Unused variables
- Variables written multiple times
- Unassigned parameters
- □ FB instances used multiple times
- Address overlapping

It is advisable to enable all options when checking a safety project.

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Unity<sup>™</sup> Pro XLS

### Unity<sup>™</sup> Pro XLS (continued)

### Protecting the project

Unity<sup>™</sup> Pro XLS provides protective functions against unauthorized access to safety projects, to the Quantum<sup>™</sup> safety PLC, and to Unity Pro XLS itself.

■ The application password, defined when the safety project was created,

- is requested:
- When the safety application file is opened
- Upon connection to the safety PLC

Application P	lassword		X
Pauset	OK	Close	

■ The safety editor integrated into Unity Pro XLS is used to define the access permissions and the list of authorized functions for each user, in particular:

- Creation and modification of the application password
- □ Activation of maintenance mode
- Adjustment of the auto-lock period

### Functions and function blocks for safety applications

Unity Pro XLS provides a set of elementary functions (EFs) and elementary function blocks (EFBs) certified for use in safety applications:

- Standard functions certified for safety applications:
- Mathematical functions and functions for manipulating data from the unrestricted memory area in the safety logic
- Comparison functions
- Logical functions, rotations, offsets
- Statistical functions
- □ Timer and counter setup
- Type conversions
- Specific functions for safety architectures:

□ Setup of high availability: choice between two discrete I/O module inputs or redundant analog inputs

□ Setup of hot standby PLC redundancy: to cause the two processors involved in a hot standby configuration to change roles from primary to standby and standby to primary, respectively. The objective is to verify the capacity of each processor to take over in case the other processor becomes inoperative. With Unity Pro XLS, this function can easily be programmed in the application by setting up the S\_HSBY\_SWAP elementary function from the library.

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Unity<sup>™</sup> Pro XLS

### Distinctive features and specific procedures

### Auto-testing software tools

Unity<sup>Track</sup> Pro XLS provides the option of performing an auto-test to verify that the software components installed have not been corrupted, for example, due to a hard disk failure. This auto-test is based on a CRC calculation.

Unity<sup>™</sup> Pro XLS checks the version and CRC:

- Of its DLLs
- □ Of the library database of the safety FFB
- □ Of the catalog database of hardware products

Unity Pro XLS auto-tests are performed upon request by the user, for example:

- Before loading the final application program onto the safety PLC
- □ Before modifying the application program executed on the safety PLC

### Time-stamping binary files

With Unity Pro XLS, every binary file generated for a safety project features a version management field that provides the date and time when it was generated. This information is useful for checking the project.

### Downloading a project to Unity Pro XLS

It is possible to download a safety project from the PLC to Unity Pro XLS under the following conditions:

□ This must have been defined as an option for the safety project.

□ The user must know the application password to establish a connection to the safety PLC.

□ The safety PLC must be placed in maintenance mode to perform the download.

#### Unrestricted memory

The unrestricted memory area contains bits and words that are not protected against write operations from external equipment such as HMI terminals, PLCs, etc.

□ It is located at the beginning of the memory.

□ Its size can be configured with Unity Pro XLS.

□ Values cannot be used directly in the unrestricted memory area and can only be used in conjunction with specific function blocks: S\_MOVE\_BIT and S\_MOVE\_WORD.

In the edit phase first and then in the generation phase, Unity Pro XLS checks to make sure than only data from the unrestricted memory area are used at the input of the function blocks S\_MOVE\_BIT and S\_MOVE\_WORD.

Furthermore, Unity Pro XLS provides a useful list of cross references, allowing easy identification of the way variables are used and verification of the application of this rule.

Note: For safety applications, it is common practice to verify the correct transfer of data by writing the data twice (to two different variables) and then comparing them.

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Unity<sup>™</sup> Pro software

Communication drivers

### **Communication drivers**

The drivers used most frequently with the Modicon<sup>®</sup> Premium<sup>™</sup> and Quantum<sup>™</sup> platforms are installed at the same time as the Unity<sup>™</sup> Pro software.

Unity Pro also includes the following communication drivers, which can be installed as required (1):

Driver type	Windows XP® Windows 2000	Windows NT®	Windows 98 Millenium®	Windows 95 <sup>®</sup>		
Uni-Telway <sup>™</sup> COM port	V1.9 IE20	V1.9 IE17	V1.7 IE18	V7.8 IE18		
Uni-Telway <sup>™</sup> TSX SCP 114	V1.2 IE05					
Modbus <sup>®</sup> COM port	V1.6 IE29					
Fip® ISATSX FPC10 card	V1.4 IE06	V1.3 IE08	V1.4 IE06	V2.4 IE08		
Fip® PCMCIATSX FPC20 card	V1.2 IE03	V1.1 IE08	V1.2 IE04			
Ethway™	V1.4 IE05	V1.1 IE03	V2.6 IE06 (2)			
ISAway <sup>™</sup> PCX 57, ISA card	V1.2 IE04	V1.5 IE06	V1.2 IE04	V1.2 IE09		
PCIway <sup>™</sup> , PCI card	V1.1 IE09	-				
XIP X-Way on TCP	V1.10 IE22					
USB for USB terminal port	V1.2 IE17	-				

### Unity<sup>™</sup> Developer's Edition, advanced open access

Advanced open access, intended for experienced IT engineers, supports the development of interfaces between Unity and expert tools, as well as specific user-defined functions.

This type of development requires experience in the following IT areas:

- C++® or Visual Basic<sup>®</sup> languages
- Client/server architectures
- XML and COM/DCOM technologies
- Database synchronization

As a supplement to the Unity Pro Extra Large software (3), the UDE (Unity Developer's Edition) development kit UNY UDE VFU CD21E enables the development of customized solutions. In addition to the development kit, the Unity servers and accompanying documentation are also provided.

Unity<sup>™</sup> Developer's Edition is compatible with:

- Unity<sup>™</sup> Pro Extra Large
- Modicon<sup>®</sup> M340<sup>™</sup> processors
- Premium<sup>™</sup> Unity<sup>™</sup> processors
   Quantum<sup>™</sup> Unity<sup>™</sup> processors

- (1) Also available separately under reference TLX CD DRV 20M.
- (2) Windows 98 only
- (3) Only the Unity Pro Extra Large version enables dynamic database management for data to be exchanged with the OFS data server or a third-party tool.

### Upgrade kits for Concept<sup>™</sup>, PL7<sup>™</sup> Pro, and ProWORX<sup>™</sup> software

These upgrade kits allow users who already have these software programs from the installed base and who have a current subscription to obtain Unity Pro version V4.0 software at a reduced price. These upgrades are only available for licenses of the same type (from Concept<sup>™</sup> XL license group to Unity<sup>™</sup> Pro Extra Large license group).

### **Composition and Windows OS compatibility**

Unity Pro multilingual software packages are compatible with Windows 2000 Professional and Windows XP operating systems.

They are comprised of the following elements:

Documentation in electronic format in 6 languages (English, German, Chinese, Spanish, French, and Italian)

Converters for converting applications created with Concept and PL7 Pro programming software

PLC simulator

Cables for connecting the processor to the programming PC must be ordered separately.

## Presentation, setup

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Unity<sup>™</sup> software

Unity<sup>™</sup> EFB Toolkit

### Presentation

 $\mathsf{Unity}^{\scriptscriptstyle{\mathrm{TM}}}$  EFB Toolkit is the software for developing EF functions and EFB function blocks in C language and is optional software for Unity<sup>™</sup> Pro. It can be used to develop new functions (whose internal code is written in C language) to extend and complete the set of functions proposed as standard in Unity Pro. This software comes with Microsoft Visual C++ @.Net® which can be used to debug the functions used on the Unity Pro PLC simulator. Unity EFB Toolkit also includes a service for creating and managing families of functions, with a view to their integration in the Unity Pro function libraries.

### Setup

C language development software is a proper tool for managing the whole function while it is being performed:

- A user-friendly creation interface, integrated in Unity Pro, with automatic file organization
- Powerful tools for testing and debugging
- Management of compatibilities and software versions of created functions Generation of files for subsequent installation of functions on other
- development stations

### Managing function families

The software can be used to define different function families. These functions, also known as EFs/EFBs, are stored in families, making it possible to create an organized library of functions written in C language.

Once created, these families can be distributed and integrated in the Unity<sup>™</sup> Pro libraries.

- They are:
- Arranged in families/functions
- Used in each language with the same flexibility as standard functions (data entry wizard)
- Managed by the Unity Pro library tool (version management)

### **Editing functions**

The various tabs in the EFB Toolkit software editor allow the user to create the function by:

- Declaring the interface, all data types are possible (elementary, structures, tables)
- Supporting public and private variables

### Writing the source code file in C language

A function written in C language can access numerous internal PLC services such as the real-time clock, PLC variables, system words, math functions. In particular, it is possible to perform numerical processing in floating point format.

# Setup (continued), references

### Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Unity<sup>™</sup> software

Unity<sup>™</sup> EFB Toolkit

### Setup (continued)

### **Debugging functions**

The function created can be tested after insertion in an application and loading into the Unity<sup>™</sup> Pro PLC simulator.

The Microsoft® Visual C++® tool is used to debug the function.

- It is used to:
- Insert breakpoints
- Perform step by step execution
- Display the code with the breakpoints visible
- Display manipulated data

**Note :** To generate the code for a Modicon M340 platform, a specific GNU compiler is used. It is supplied with the Unity<sup>™</sup> EFB Toolkit.

### Enhancing the function library

As the function has been debugged, it can be generated and distributed, and the updating tool supplied with Unity Pro can be used to enhance the libraries on a user station.

Version management means that at any time the user knows the level of functions installed on a station and can update the application with the latest existing versions.

### Compatibility

Unity  $^{\mathbb{M}}$  EFB Toolkit is compatible with Unity  $^{\mathbb{M}}$  Pro Small, Medium, Large, and Extra Large.

Developing EF functions and EFB functions is possible with the Modicon<sup>®</sup> Premium<sup>™</sup>, M340<sup>™</sup> and Quantum<sup>™</sup> platforms.

### References

The "companion" software for Unity Pro, Unity EFB Toolkit can be used to create EF elementary blocks and EFB elementary function blocks. These are developed in Visual C++ language and are integrated in Unity Pro function block libraries. The Unity EFB Toolkit software and its documentation are supplied in electronic form on CD-ROM in English.

## Presentation

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Unity<sup>™</sup> software

Unity MSFC View

### Presentation

Unity<sup>™</sup> SFC View is integrated in human/machine interface (HMI) applications for monitoring Unity<sup>™</sup> Pro sequential applications written in sequential function chart language (SFC<sup>™</sup> or Grafcet<sup>™</sup>) executed by a PLC.

Set up in the same way as an ActiveX control component, Unity SFC View is used to display status information relating to SFC charts executed by a Modicon<sup>®</sup> Premium<sup>¬</sup>, M340<sup>¬</sup> or Quantum<sup>¬</sup> PLC. Installed on an HMI station, Unity SFC View monitors and controls the status of SFC charts in real time, supplying detailed diagnostic data.

Unity SFC View reads the necessary data from the Unity project database in offline mode. The PLC data is accessed online via the OFS (*OPC Factory Server*).

Without needing to recreate SFC charts in the HMI environment, Unity SFC View reads the structure of the SFC charts directly from the Unity project database. Modifications made to the SFC application are detected and updated at any time. In online mode, Unity SFC View accesses the PLC diagnostic data, thus enabling awareness and tracking of the occurrence of the first detected fault and subsequent detected faults. System downtime is much reduced since Unity SFC View enables maintenance staff to locate the source of the problem much more quickly.

Unity SFC View is designed for end users and system designers who wish to integrate this control into their HMI system. Unity SFC View is compatible with most HMI platforms handling ActiveX Control components, such as Vijeo Look<sup>m</sup> control software, or Monitor Pro<sup>m</sup> supervisory software, or in a programming environment such as Visual Basic<sup>®</sup>.

# Presentation (continued)

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Unity<sup>™</sup> software

Unity<sup>™</sup> SFC View

#### The 3 views of Unity<sup>™</sup> SFC View software

Unity<sup>™</sup> SFC View offers 3 views:

■ An overview for managing selection of SFC<sup>™</sup> charts

Two detailed views presenting the status and diagnostic data of the selected SFC chart

Simple detailed view

The overview provides a general view of the SFC charts in a Unity project. It contains real-time data such as current step, simultaneous steps, detected chart error with indication of the SFC chart status. The overview makes it easy to browse through SFC charts and switch quickly to the detailed view of the desired SFC chart in the Unity<sup>™</sup> Pro application.

The simple detailed view shows the elementary data on the active step (or selected step) of the SFC chart in real time. The data displayed may include the name, comment, chart and step status, as well as the activity times (min, max, actual). You can also enable the chart navigation option.

Because of the compact size of the simple detailed view, it is possible to place several instances of it on a single HMI screen relating to a certain part of the process. From this simple detailed mode, you can navigate between HMI screens with SFC View controls and display the detailed view of SFC charts.

The detailed view illustrates the details of an SFC chart in real time. The display indicates the current step, the transition awaiting activation and the next step. The

actions associated with the steps are displayed along with sequence selections or parallel branches. The detailed diagnostic data includes analysis of the causes of the detected fault at transition level. Depending on the diagnostic mode, the error grid contains the causes of detected errors or the variables assigned to the transition logic. The current state of the various variables and selected errors are identified by

Transition logic diagnostics is a key function of Unity SFC View. It minimizes system

■ Unity<sup>™</sup> SFC View reads the data in the Unity<sup>™</sup> PLC diagnostic buffer. It provides information about improper or missing events that are preventing the transition from

■ Unity<sup>™</sup> SFC View monitors the internal logic of the transition conditions "back to front". This mode provides diagnostic data concerning the inputs connected to the transition (not limited to inoperative inputs). In this mode, for Premium and Quantum platforms, Unity SFC View uses specific EFB function blocks linked to the transition conditions. The library for these blocks is supplied with the Unity SFC View software.

being enabled. This mode does not require any configuration or additional

downtimes in the event of a detected fault.

programming in the PLC program.

Two different diagnostic modes are available:

Unity SFC View offers a programming interface which can be used to integrate the ActiveX Control component in an HMI application and customize its functions and its operator interface.

The ActiveX Control component in Unity SFC View can be customized. It accepts properties, methods and events (the properties have a default value). The properties pages simplify configuration. Unity SFC View accepts scripts with methods such as browsing through charts, status control of charts, and also events such as detected error notification or chart selection. This data can be used to launch programs or operator screens.

# Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Unity<sup>™</sup> software

Unity<sup>™</sup> SFC View architectures

#### **Possible architectures**

#### Basic architecture

Unity<sup>™</sup> SFC View is used in a configuration where the OFS<sup>™</sup> and Unity<sup>™</sup> Pro software reside on the same PC platform as the HMI application.

#### **Distributed architecture**

In a distributed configuration, the OFS<sup>™</sup> and Unity<sup>™</sup> Pro software can be installed on different servers.

# References

# Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Unity<sup>™</sup> software

Unity<sup>™</sup> SFC View

#### References

When integrated in an HMI application, Unity<sup>™</sup> SFC View can be used to monitor and control charts in applications developed in Sequential Function Chart (SFC)<sup>™</sup> language running on Premium<sup>™</sup>/Quantum<sup>™</sup> Unity<sup>™</sup> PLCs.

The HMI station, compatible with Windows 2000<sup>®</sup> or Windows XP Professional<sup>®</sup> operating systems, must support ActiveX Control components. Unity SFC View V2.0 requires:

- Unity<sup>™</sup> Pro V3.● XL, to be ordered separately
- OFS V3.3 data server software, to be ordered separately

Unity SFC View multilingual software, supplied on a CD-ROM, includes:

- The SFC View ActiveX Control component
- The EFB function block library for Unity Pro V3.
- An example of how to integrate SFC View in Unity Pro projects
- The electronic documentation (English, French and German)

The Unity SFC View integration example illustrates the main possibilities offered by Unity SFC View. This is an executable program which does not need HMI software in order to run. It helps the user understand how to configure and use the Unity SFC View ActiveX Control component.

Unity<sup>™</sup> Software Unity<sup>™</sup> Dif application comparison software

#### Presentation

Unity<sup>™</sup> Dif application comparison software for Modicon<sup>®</sup> Premium<sup>™</sup>, Quantum<sup>™</sup> and M340<sup>™</sup> platforms is an optional program which complements the Unity<sup>™</sup> Pro Extra Large programming software. It is used to compare two Unity applications generated by Unity Pro and automatically provide an exhaustive list of the differences between them.

The Unity Dif program increases productivity in the main life phases of a control system based on a M340/Premium/Quantum platforms:

- Application development and debugging
- Starting up installations and processes
- Operation and maintenance of installations and processes.

Unity Dif software is an efficient tool for handling Unity applications for:

- Control system design offices
- Operation and maintenance managers
- Installers and systems integrators.

#### Software setup

Unity<sup>™</sup> Dif software can be used in one of two modes:

■ Interactive mode, when the comparison is launched by an operator command (double-click on the Unity Dif software icon)

Automatic mode, when it is launched by a previously established call command.

These comparison commands locate the differences between two applications in terms of:

- Hardware configuration (Modicon M340/Premium/Quantum)
- Network configuration (Ethernet TCP/IP network, CANopen bus and RIO remote I/O)
- Entire range of variables and function block instances
- Application structure and its content (regardless of the language(s) used)
- Function modules
- Code for the DFB user function blocks and DDT compound data
- Project options.

The result of the comparison between the two applications can be:

- Displayed
- Printed
- Saved in .txt format in a differences list.

#### Comparison

The end of the comparison operation is signalled by the appearance of the application browser with its two tabs.

1 Identification tab for accessing the characteristics of the two applications being compared. The differences are marked by the sign #

**2** Browser tab for accessing the application multilevel tree structure.

(1) RIO remote I/O for Modicon Quantum platform.

Unity<sup>™</sup> Application Generator (UAG)

Structured Project Design - bridge from the process engineer to the control/ automation designer (from the P&ID to the automation system). Capture and re-use of the Customer's best practices within application specific libraries that reduce the dependency on experts, enable standardization and increase software robustness. Single Database entry avoids duplicate effort and resulting errors. Automatic Application Generation including the automatic configuration of networks in multi device systems increases efficiency, improves software quality, speeds commissioning while simultaneously reducing project risk. Integrated change tracking and automatic documentation generation reduces engineering effort and enables system validation.

#### Advanced Automation platform

UAG integrates best-in-class products from Schneider Electric and leading partners into an advanced automation platform based on standards, including ISA-88, GAMP, IEC 61131-3:

- Premium<sup>™</sup>/Quantum<sup>™</sup> PLCs.
- Premium I/O, Quantum I/O, Momentum<sup>™</sup> I/O, Advantys<sup>™</sup> I/O.
- Leading HMI/SCADA systems including Vijeo® Citect® and Monitor Pro<sup>™</sup>.
- Modbus<sup>®</sup> TCP/IP communication.
- OPC data server software (OFS)<sup>™</sup>.
- Fieldbus support.

Single data point entry and management integrates the process control, monitoring and supervision and helps to ensure data consistency and integrated communication between all devices.

# Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Unity<sup>™</sup> software

Unity<sup>™</sup> Application Generator (UAG)

#### **Working with UAG**

Methodology

UAG enables you to capture and re-use your know-how.

Your standards, rules, instructions, configurations and naming convention are defined in the UAG library. Using UAG, OEMs and System Integrators can deploy their standards easily and consistently.

Through automatic generation, the project information is propagated to applications consistently, easily and quickly.

#### Creating user libraries

Libraries are based on re-usable control devices - Smart Control Devices (SCoDs).

SCoDs are versatile, multi-faceted objects describing the functional, control, supervisory and configuration aspects of your process elements.

Based on control logic (DFB/EFB) and its graphical description (symbol), the definition of control devices is enhanced and organized in libraries. Existing control logic / symbols can be used directly.

The SCoDs encapsulate **your** standards and rules. They are pre-qualified and deployed according to the UAG methodology. A simple parameterization allows the usage within the project, automatically taking care of the application and device specific context including communication definitions.

#### Structuring your project

A Structured Project Design - bridge from the process engineer to the control automation designer (from the P&ID to the automation system) based on the ISA-88 standard. The P&ID drawing is mapped to the physical model in UAG.

This process can be automated through import functions providing UAG the specific parameterization of the model.

- PLC related requirements:
- □ location of devices and functions,
- □ interlocking,
- □ data communication.
- HMI/SCADA related requirements:
- □ process visualization,
- □ operator control,
- □ logging, trends, alarms....

Inside UAG the entire process controls, monitoring and supervision topology of the distributed automation system is managed.

Global resources for networks and communication are managed. Device specific resources like I/O definition and address management are also automatically configured.

No platform or application specific expert knowledge is required. UAG translates the customer requirement into the automation solution.

# Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Unity<sup>™</sup> software

Unity<sup>™</sup> Application Generator (UAG)

#### Working with UAG (continued)

#### Generating the application

Based on the structured design and your standards contained within the pre-qualified UAG library, the automation solution is generated helping to ensure consistent information for the PLCs and the HMI/SCADA. The resources (addresses, name space...) are used in an optimized mode without conflicts or errors.

UAG can generate complete projects and also **incremental changes** when modifications occur.

- For the PLC:
- variables,
- □ IEC 61131-3 compliant logic,
- □ I/O configuration,
- communication
- For the HMI/SCADA the complete server and client application :
- □ screens,
- □ symbols,
- □ variables,
- □ trends and alarms,
- □ access attributes (security, access).
- Complete pre-configured and optimized communication between devices and the HMI/SCADA:
- □ Modbus® TCP,
- □ OPC data server software (OFS)<sup>™</sup>.
- Documentation and change tracking:
- □ automatic documentation of the application,
- □ change tracking supporting FDA compliancy.

#### Validation

UAG simplifies validation when required by regulation or to comply with GAMP (Good Automation Manufacturing Practice).

UAG uses ISA 88 standard terminology for batch control and supports the GAMP methodology for creating an automation system.

The use of these two standards is a key element to achieve process validation. In addition, UAG provides:

- Process information at a single point, based on functional analysis.
- Automatic generation of process applications by UAG.
- Archiving which supports 21 CFR 11 compliance.
- A log of interactions by UAG.
- Electronic documentation.

# Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Unity<sup>™</sup> software

Unity<sup>™</sup> Application Generator (UAG)

### Working with UAG (continued)

#### **Basic Libraries**

A Basic Library is available providing sample SCoDs as a template to develop your library. Basic functions include:

- □ Input/Output processing,
- □ motor (1/2 speed, 1/2 directions),
- □ valves (Mono, Bistable, proportional),
- □ control (PID),
- □ Schneider Electric devices (Altivar<sup>®</sup>, Tesys U<sup>®</sup>),
- □ PLC Status.

#### Segment/Application specific libraries

A number of more specialized libraries have been developed which provide a more complete starting point for the projects, for example:

- Water.
- Cement.
- Metal processing.

#### Supported platforms

#### PLC Software

- □ Unity<sup>™</sup> Pro V2.3 or higher,
- □ Concept<sup>™</sup> V2.6 or higher.
- PLC Hardware
- □ Premium<sup>™</sup>, Quantum<sup>™</sup>,
- □ Premium I/O Quantum I/O, Momentum<sup>™</sup> I/O, Advantys<sup>™</sup> STB I/O,
- □ Modbus®-TCP, Modbus+.
- HMI/SCADA
- □ Monitor Pro<sup>™</sup> V7.2 /V7.6,
- □ Vijeo® Citect®,
- □ other HMI/SCADA via the UAG "Plug-In" interface.
- Export of information for other devices / applications
- □ XML export file,
- □ CSV export file.

#### References

This specialized software program UAG (Unity Application Generator) is multilingual (available in English, French and German) and compatible with the Windows 2000 Professional® and Windows XP® operating systems.

Documentation is supplied in electronic format.

The PLC/SCADA programming tools and/or communication driver must be ordered separately.

# Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Unity<sup>™</sup> Pro software

Process control

#### Two Unity<sup>™</sup> Pro process control offers

**User-definable control loops** 

This offer of user-definable control loops is integrated as standard in Premium™ TSX<sup>™</sup> 57 2e/3e/4e/5e/6e platforms with Unity<sup>™</sup> Pro Medium, Large, Extra Large and XLS software.

This offer is identical to that offered with PL7<sup>™</sup> Junior/Pro, except for the runtime screens.

See pages 6/53 and 6/57.

#### Programmable control loops

The process control offer for Premium TSX 57 20/30/40/50/60 platforms with Unity Pro Medium, Large, Extra Large and XLS software has been enhanced with the new programmable offer.

This offer is based around the EF and EFB function block library specific to process control. More than 30 blocks are available, classified in 6 families:

- EFB blocks for data preparation (for example, DTIME, INTEGRATOR, SCALING, etc)
- Controller EFB blocks (for example, AUTOTUNE, PIDFF, SAMPLETM, etc)
- Math EF blocks (for example, COMP\_DB, MULTIV\_M, SUM\_W, etc)
- Measurement processing EF/EFB blocks (for example, LOOKUP\_TABLR1, HYST\_●●●, AVGMV, etc)
- Output value processing EFB blocks (for example, PWM1, SERVO, etc)
- Reference value processing EFB blocks (RAMP, RATIO, SP8SEL)

These blocks manage operating modes such as tracking, manual/automatic mode and process control algorithms on cyclic values (intervals between two consecutive sampling operations).

See pages 6/58 and 6/59.

# Presentation (continued)

# Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Unity<sup>™</sup> Pro software

User-definable process control

#### User-definable process control

The process control offer integrated as standard in Premium<sup>™</sup> platforms can be used to set up and debug machine control-oriented control loops in Unity<sup>™</sup> Pro Large and Extra Large.

#### User-definable process control functions

TSX<sup>™</sup> P57 2●4/2634/3●4/3634/454/4634/554/5634/6634M CPUs and TSX<sup>™</sup> PCI 57 204/354M slot PLCs make it possible, depending on the model, to manage between 10 and 30 process control channels (of 3 loops each). These channels can be configured to execute algorithms for industrial processes:

- Cascaded loop
- Process loop
- Autoselective loop
- Setpoint programmer
- Controller with three simple loops

#### Inputs/Outputs

# TSX P57 2e4/2634/3e4/3634/454/4634/554/5634/6634M CPUs and TSX PCI 57 204/354M slot PLCs manage an entire station consisting of racks connected on Bus X.

The I/O interfaces required for process control processing operations are analog or discrete channels in:

- "In rack" I/O modules
- TBX, Advantys<sup>™</sup> STB or Momentum<sup>™</sup> distributed I/O modules

#### **Control loops**

Software setup of the control loops is user-definable (Plug and Play technology) during configuration of the Premium CPU.

The user enters information in the predefined loop diagrams which also integrate management of operating modes and the link with the I/O.

# Presentation (continued), functions

# Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Unity<sup>™</sup> Pro software

User-definable process control

#### **Presentation** (continued)

#### TSX<sup>™</sup> P57 2●4/2634/3●4/3634/454/4634/554/5634/6634M CPUs and

**TSX<sup>™</sup> PCI 57 204/354M** slot PLCs offer the possibility of configuring 10, 15, 20 or 30 control channels for continuous or semi-continuous processes.

The process control functions offered by these CPUs are particularly suitable for:

Sequential processes requiring auxiliary process control functions such as

packaging machines, surface treatment machines, presses, etc

Simple processes such as metal treatment furnaces, ceramic ovens,

refrigeration units

Servo-control systems or mechanical process control where the sampling time is critical, such as torque control, speed control, etc

Premium<sup>™</sup> CPUs include the following characteristics:

■ Each configurable process control channel can be used to manage 1 to 3 loops depending on the type of loop selected

Process control processes can be inserted in the overall architecture of a site,

thanks to the integration of the PLC in different communication networks

Process control-related calculations are performed in floating point arithmetic expressed in physical units.

Description and characteristics: **TSX P57 ••4/••34M** CPUs, see pages 1/6 to 1/11; **TSX PCI 57••4M** slot PLCs, see pages 1/16 to 1/20.

#### **Functions**

#### **Control loops**

Premium CPUs can be used to set up 10 to 30 process control channels, each adopting one of the following 5 control profiles:

- Process-type loop: loop with a single controller
- Controller with 3 simple loops: controller used to increase the capacity of the number of loops

Autoselective loop, also called secondary loop: consisting of 2 loops in parallel with an algorithm for selecting the output

- Cascaded loop: consists of 2 dependent loops (the master loop output is the slave loop setpoint)
- Setpoint programmer: consisting of a maximum of 6 composite profiles, with a total of 48 segments

As the channels are independent, configuration of 10 channels can be used for example to obtain:

- 30 simple loops
- 5 setpoint programmers, each associated with 5 control loops
- 2 setpoint programmers and 8 process loops
- The various loops are characterized by:
- Their different algorithms

■ 5 processing branches (measurement, setpoint, Feed Forward, controller and output processing)

■ Calculation functions (gain, filtering, square root, etc) defined using parameters.

#### Types of control loop

Predefined algorithms can be defined by the user and are represented as shown below:

#### Simple loop

#### Autoselective loop

6/54

Process loop

#### Cascaded loop

# Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Unity<sup>™</sup> Pro software

User-definable process control

#### **Processing branches**

Parameter-setting (selection of the functions to be used) of the control loop profiles can be used to adapt the algorithm to the process to be controlled.

#### Measurement processing

Measurements can be processed either in the standard way or externally. ■ Standard processing: The user can access the following functions: filtering, setting measurement between limits, function generator with scaling, management of alarms on threshold overshoot, totalizer and simulation of the measured value.

■ External processing: This means there can be a process value PV at the controller input which has been processed outside the control loop. This is a handy solution if calculation of the measurement requires special or customized functions.

#### Setpoint processing

Depending on the type of loop selected, it is possible to opt for one of the following 4 types of setpoint: ratio setpoint, selection setpoint, simple setpoint ("remote" with scaling) or setpoint programmer.

In the case of the controller with 3 simple loops or the secondary loop (in an autoselective loop), only the simple setpoint and the setpoint programmer can be used.

#### Feed Forward processing

Feed Forward processing can be used to compensate for a measurable disturbance as soon as it appears. This open loop processing anticipates the effect of the disturbance. It features the "Leading" function (lead/lag phase).

#### Controller and command processing

The controller can be chosen from the following 6 types: Self-tuning PID, controller in discrete mode with 2 or 3 states, hot/cool controller (PID or self-tuning model) or Split Range controller (PID or self-tuning model).

#### Output processing

There are 3 types of output which can be processed: analog output, servomotor output or PWM output. Whatever the type of output, the command calculated by the controller crosses a gradient limiter and a limiter whose upper and lower limits are used to define the output variation range.

#### Setpoint programmer

The setpoint programmer offers a maximum of 6 profiles consisting of a total of 48 segments. It is thus possible to create various programmer/segment configurations, e.g. one programmer with 48 segments, 6 programmers with 8 segments or one programmer with 24 segments plus one programmer with 16 segments and one programmer with 8 segments, etc.

Each segment is configured as either a ramp or dwell step. It is characterized by: The setpoint to be reached

The duration of the segment or slope of the segment (if it is a ramp)

A profile can be executed once, a certain number of times or looped continuously. In addition, the concept of a specified dwell step means the time is only counted down if the measurement is definitely within the specified range.

#### Configuring process control channels

Configuring a process loop

#### **Configuring process control channels**

Special screens, accessible using Unity<sup>™</sup> Pro software, can be used to configure control loops.

#### Configuring process control channels:

The "Loops" interface in Premium<sup>™</sup> CPUs simplifies configuration by offering simple selections from menus:

- The type of loop from 5 options
- The choice of functions used in the 5 processing branches
- The parameters linked to each of the functions

■ The assignment of PLC variables to the different loop branches (memory words, input words or output words depending on the processing branch)

Automatic presymbolization of the variables used in loops

When configuring process, simple, autoselective and cascaded loops, default parameter settings are offered. The various functions integrated in the algorithms (square root, function generator, etc) and the initial value of each parameter are predefined.

#### Example: Configuring a process loop

Once the type has been chosen, its parameters can be set by selecting or deselecting the options in the processing branches. No programming is therefore necessary, the loop diagrams are enhanced or simplified as and when the parameters are validated. Opposite, selecting the PID controller enables display of the various valid parameters for this type of controller (KP, TI, TD, etc).

In the case of the setpoint programmer, the different profiles (6 maximum) are configured via a table defining each segment.

After selecting the type of segment (ramp or dwell step), its configuration consists of defining the setpoint to be reached (with the ramp) and the duration (for the ramp or dwell step).

As selections are made, the bottom of the screen displays the profile with the setpoint limit values.

This screen can also be used to define the cycles for this profile: execution once, a certain number of times or looped continuously (32,767 times maximum).

#### **Executing process control channels**

The sampling period for the loops is predefined at 300 ms. This defines the controller processing period in automatic mode. It is possible to modify this period in the loop configuration screen.

The I/O and the parameters of the various configured process control channels can be accessed by the user at program level or via the various Unity Pro software tools (especially language editors and animation tables).

6

Defining profile cycles

# Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Unity<sup>™</sup> Pro software

User-definable process control

#### **Debugging functions**

Adjusting and debugging control loops is simple and user-friendly via, for example, the application-specific loop configuration screen which, in online mode, provides access to the following functions:

- Display and animation of the loop algorithm diagram
- Display of process alarms and channel faults
- Simulation of the input interface values: for example when these are not connected (measurement, Feed Forward)
- Addition, deletion or replacement of calculation functions in online mode
- Modification of the adjustment parameters for each of the functions
- Modification of the controller operating modes and manual control mode

With the controllers integrated in the control loops, it is possible to use the autotuning function which calculates a set of adjustment parameters (Kp, Ti, Td or Ks, T1, T-delay) on request.

Once the loop has been debugged, it is possible to save the current values resulting from the tests in the initial loop parameters values. This means that, on restarting the loop, it will start off with the correct values.

Debugging a loop

The debug screen can be used to:

- Display the values of the variables linked to the loop in real time
- Know which parameters have been selected (and even modify them)
- Display alarms

The menus can be used for manual control of the loop, autotuning, parameter backup, etc.

Debugging a loop

Debugging the setpoint programmer

#### Debugging the setpoint programmer

The setpoint programmer channels have their own debug screen which can be used to display:

- The number of the active segment and the iteration
- The execution time for the active segment
- The overall execution time

Programmable process control

CONT\_CTL, programmable process control integrated in Unity Pro

#### **Process control in machines**

Unity  $^{\rm \tiny M}$  Pro contains CONT\_CTL, a library of 36 function blocks used to create control loops for machine control.

Requirements for closed loop control functions in machines are adequately met by Modicon<sup>®</sup> Premium<sup>™</sup>, Quantum<sup>™</sup> and M340<sup>™</sup> platforms, thanks to the wealth of functions in the library and the flexibility with which function blocks can be linked together through programming. This solution therefore eliminates the need for external controllers, and simplifies the overall control architecture of the machine, as well as its design, roll-out and operation.

The function blocks, EF or EFB, can be used in Unity Pro languages i.e. LD, ST, IL and FBD. FBD is particularly suitable for accessing control processing operations in Unity Pro through its assistant for entering and viewing parameters and function block variables.

#### CONT\_CTL library functions

The library consists of five function families:

- Input data conditioning
- Controllers
- Math functions
- Measurement processing
- Output value processing

Input data conditioning	
DTIME	Pure delay
INTEGRATOR	Integrator with limiting
LAG_FILTER	First order time lag device
LDLG	PD device with smoothing
LEAD	Differentiator with smoothing
MFLOW	Mass flow calculation based on the measurement of differential pressure or flow speed with pressure and temperature compensation
QDTIME	Deadtime device
SCALING	Scaling
TOTALIZER	Integrator (typically of flow) until a limit (typically a volume) is reached, with automatic reset
VEL_LIM	Velocity limiter, with manipulated variable limiting
Controllers	
PI_B	Simple PI controller: PI algorithm with a mixed structure (series/parallel)
PIDFF	Complete PID controller: PID algorithm with a parallel or mixed structure (series/parallel)
AUTOTUNE	Automatic tuner setting for the PIDFF (complete PID) controller or the PI_B (simple PI) controller Identification using Ziegler Nichols type method Modeling based on 1 <sup>st</sup> order process Building of control parameters with criterion for prioritizing either the reaction time to disturbance (dynamic) or the stability of the process
IMC	<ul> <li>Model corrector. The model is a first order model with delay. This corrector is useful:</li> <li>When there are serious delays compared with the main time constant of the process; this scenario cannot be satisfactorily resolved by standard PID process control</li> <li>For regulating a non-linear process</li> <li>IMC can handle any stable and aperiodic process of any order.</li> </ul>
SAMPLETM	Control of controller startup and sampling
STEP2	Two-point controller
STEP3	Three-point controller for temperature regulation
Math functions	
COMP_DB	Comparison of two values, with dead zone and hysteresis
K_SQRT	Square root, with weighting and threshold, useful for linearization of flow measurements
MULDIV_W	Weighted multiplication/division of 3 numerical values
SUM_W	Weighted summation of 3 numerical values

Example: PID controller with MS manual control

# Functions (continued), setup

# Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Unity<sup>™</sup> Pro software

Programmable process control

Programming in Unity Pro in offline mode

<b>CONT</b> CTL library	functions (continued)
Measurement processing	
AVGMV	Moving average with fixed number of samples (50 max.)
AVGMV_K	Moving average with constant correction factor, 10,000 samples max.
DEAD_ZONE	Dead zone
LOOKUP_TABLE1	Linearization of characteristic curves using first-order interpolation
SAH	Detection of a rising edge
HYST_XXX	Detection of high threshold with hysteresis (1)
INDLIM_XXX	Detection of high and low thresholds with hysteresis (1)
Output value processing	
MS	Manual control of an output
MS_DB	Manual control of an output with dead zone
PWM1	Control via pulse width modulation
SERVO	Control for servo motors
SPLRG	Control of two Split Range actuators
Setpoint management	
RAMP	Ramp generator, with separate ascending and descending ramps
RATIO	Ratio controller

Programming in online mode

#### Setup

SP\_SEL

#### Setting up process control function blocks

Based on the sequencing of function blocks, the FBD language integrated into Unity<sup>™</sup> Pro is a programming language particularly suitable for building control loops. Designers can use FBD to easily associate blocks from the CONT\_CTL library with their own DFB blocks written in Unity Pro's ST, IL or LD language, or in C language.

Selection of setpoint value: local (operator) or remote (processing)

#### Debugging, operation

Unity Pro's standard debugging services (see page 6/23) are available. In particular, the Modicon M340 processor simulator can be used to check correct execution of processing offline.

#### Compatibility

The CONT\_CTL control function block library is available in each version of Unity Pro. It is compatible with processors in the Modicon<sup>®</sup> Premium<sup>™</sup>, M340<sup>™</sup> and Quantum<sup>™</sup> ranges.

#### Resources

The technical documentation provides many examples of how to set up programmable process control function blocks in FBD, LD, IL and ST languages.

The techniques for adjusting process control loops are described in the document "Process control, Unity V3.0" available on the www.schneider-electric.com website.

# Modicon<sup>®</sup> Premium<sup>™</sup> automation platform PL7<sup>™</sup> software

#### Presentation

PL7<sup>™</sup> Micro/Junior/Pro software packages are designed for Windows 2000<sup>®</sup> Professional and Windows XP<sup>®</sup> (1) operating systems, providing advanced functionality to a wide range of facilities.

PL7<sup>™</sup> version 4.4 enables new Modicon<sup>®</sup> Premium<sup>™</sup> TSX Micro<sup>™</sup> modules to take advantage of additional functionalities:

- PL7 software registrations by the Internet, electronic mail, fax or phone (obligatory registration before 22nd day).
- Change in the Fipio<sup>®</sup> catalog for Momentum<sup>™</sup> distributed I/O.
- Transfer of PL7 user rights between PCs via floppy disk or network.

■ Enriched export files of the data application (FEF) for better compatibility with Unity<sup>™</sup> software after migration.

PL7 Micro Junior/Pro software packages are offered according to two alternatives depending on the type of PLCs/PC cable: connection on the RS 232C port, or the USB port of a PC.

#### Ergonomics of the software

PL7™ offers more user-friendly and productive ergonomics thanks to:

- Access to contextual menus by right-clicking with the mousefor fast access to the services available for the selected object.
- Contextual help: direct access to help correspondingto the selected object.
- Tool tips: explanatory messages appear when skimming over the toolbar buttons.

#### Multi-instance

The multi-instance function enables several applications to be worked on simultaneously.

- This function enables:
- Several different applications present on the PC to be opened in offline mode in order to check or copy data.

■ Debugging of two (or more) applications on two PLCs present on the same network in on-line mode. This is particularly useful when debugging inter-PLC communication functions.

#### Management of access rights

Use of the various PL7 software functions can be limited and controlled by managing the access rights.

There are 5 user profiles (differentiated by passwords) which characterize the functions available to users on the programming terminal. The profiles range from read-only access to an application (lowest profile) to full programming (profile with the most rights).

#### Application server

PL7<sup>™</sup> Pro software can be launched in OLE Automation server mode from a third-party client application. In this case, certain PL7 program functions can be executed following commands sent by an OLE client application. This instance of the program then no longer reacts to commands from the operator keyboard. Server mode can be launched in offline mode (COM) if both programs are on the same machine, or in remote mode (DCOM), if the programs are installed on different machines.

The commands available are as follows:

Manage an execution context (open/close an application, modification of the address and driver of the connected PLC; PLC status).

- Control the PLC (connection/disconnection, send a RUN/STOP/INIT command, program uploading/downloading).
- Read data (application or symbol export only in source format, read

symbol/comment associated with an address, read application identity).

<sup>(1)</sup> However, compatibility with the Windows 95 operating system is no longer provided and USB port is not compatible with Windows 95 and Windows NT 4.0.

Setup

# Modicon<sup>®</sup> Premium<sup>™</sup> automation platform PL7<sup>™</sup> software

Application creation / Debugging tools

#### Application creation and debug tools

#### Application browser (conventional view)

Access to programming and debug tools is gained via the application browser. This gives a global view of the program and enables the application components to be accessed quickly via contextual menus.

- 1 Configuration editor.
- 2 Program editor.
- 3 DFB user function block editor.
- 4 Variable editor.
- 5 Animation table editor.
- 6 Documentation editor.
- 7 Operating screen editor.

#### Concept of sections and Grafcet<sup>™</sup> enhancement

In order to make programs more comprehensible, the FAST and MAST tasks are split into sections.

Each section 1 has a name, a comment and is programmed in one of the four languages available in PL7.

A section programmed in Grafcet<sup>™</sup> language can contain a main chart 2 and macro-steps 3. Version ≥ V4.0 of PL7<sup>™</sup> allows comments to be added to each macro-step.

To protect intellectual property or avoid any unwarranted modification, each section can be write-protected or read/write-protected.

#### Function views of an application

PL7<sup>™</sup> Pro software can be used to structure an application for a Premium platform into functional modules that are broken down into sections (program code), animation tables and operating screens. Independently of the multi-task structure of the PLC, the designer can define a multilevel tree structure of the automation application.

At each level, it is possible to attach program sections written in Ladder language (LD), Structured Text (ST), Instruction List (IL), Grafcet (SFC)<sup>™</sup>, and animation tables.

Two types of view are always available:

A representation showing a tree structure of modules can provide a breakdown according to consistent functions in relation to the process to control.
 The classic representation of the application browser provides a view of the execution order of the program sections for each PLC.

The operation services associated with the functional view are available in one or the other view. In particular, a single command can be used to force whether or not a functional module is executed.

In this case, every section attached to the functional module is automatically forced.

#### Exporting/importing functional modules

Up to 100% of the tree structure can be exported into functional modules. In this case, program sections of the different module levels are exported. During an import, an assistant can be used to reassign the data associated with the module in stages.

<u>\*</u>:

#### **Configuration editor**

#### Hardware configuration

The configuration editor intuitively and graphically enables the declaration and configuration of the various components of the Modicon<sup>®</sup> Premium<sup>™</sup>/TSX Micro<sup>™</sup> application:

- Processor, coprocessor
- Tasks
- Application-specific I/O modules
- Memory

By clicking on an unconfigured position, the display of a dialog box shows the available I/O modules, classed according to family.

Once the various modules are positioned, selecting them accesses parameter entry for each module.

#### Software configuration

The configuration editor can also be used to set the software parameters of the application: choice of the number of constants, number of internal words and the number of each type of function block.

The configuration editor provides access to parameter entry for the function blocks. The copy/paste function for these parameters is available from version  $\ge$  V4.0 of the PL7<sup>TM</sup> software onwards.

#### **Configuration of Grafcet objects**

When programming in Grafcet<sup>™</sup> language, the configuration editor can define Grafcet objects (steps, macro-steps, etc.) and execution parameters (number of steps and active transitions).

#### Setup of application-specific functions

A number of tools are provided as standard for setting up the various applications: discrete I/O, analog I/O, counting, motion control (1), man-machine interface (MMI), communication, weighing (1), Warm Standby redundancy (2).

The parameter screens for the application-specific functions are accessed from the I/O configuration screen by clicking on the position in which the module has been defined.

The screens enable the main operating characteristics of the chosen application to be defined, for example:

- Filter values for discrete I/O.
- Voltage or current range for analog I/O.
- Threshold values for counting.
- Path of axes for position control.
- Calibration change during weighing.
- Transmission speed for communication.

#### (1) PL7 Junior/Pro function available on a Premium platform.

(2) PL7 Junior/Pro function available on a Premium platform based on a TSX P57 353/453M processor (version with integrated Fipio link).

# Modicon<sup>®</sup> Premium<sup>™</sup> automation platform PL7<sup>™</sup> software

#### Software structure

PL7<sup>™</sup> Micro/Junior/Pro software offers two types of structure:

■ Single task: this is the simplified structure offered by default, where a single master task consisting of a main program, comprising several sections and subroutines, is executed.

■ Multi-task: this structure, which is better suited to high-performance real-time applications, consists of a master task, a fast task and event-triggered tasks, which have the highest priority. Master and fast tasks are divided into sections.

PL7 program tasks are comprised of several parts called sections and subroutines. Each section can be programmed in the appropriate language for the processing to be carried out.

Such division into sections enables a structured program to be created and program modules can easily be generated or added.

Subroutines can be called from any section of the task to which they belong or from other subroutines in the same task.

#### Simple task software structure

- There are two types of cyclic execution:
- Normal cyclic execution. This is the default option.

■ Periodic execution. This type of execution, as well as the period, are selected by the user during configuration.

#### Normal execution (cyclic)

SR0

At the end of each scan, the PLC system launches the execution of a new scan. The execution time of each scan is monitored by a software watchdog whose value is defined by the user.

In the event of overrun, a detected fault will cause:

- The scan to stop immediately (STOP).
- A display on the front panel of the PLC.
- The alarm relay of the main rack power supply to be set to 0.

#### Periodic execution

A new scan is executed at the end of each period. The execution time of the scan must be less than the time of the period defined (1 to 255 ms). In the event of overrun, the latter is stored in a system bit (%S19), which can be set to 0 by the user (by program or by the terminal).

A software watchdog which can be configured by the user monitors the scan time. In the event of overrun, a detected execution fault is signaled (see normal execution).

## Software structure (continued)

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform PL7<sup>™</sup> software

Multi-task software structure

#### Multi-task software structure

- PL7<sup>™</sup> Micro/Junior/Pro software offers a Multi-task software structure, consisting of:
- A master task (divided into sections, one of which may contain Grafcet<sup>™</sup>).
- A fast task (divided into sections).
- One or more event-triggered tasks (only one section per task).

These tasks are independent and are executed in "parallel", with the PLC processor managing the execution priority. When an event occurs, or at the start of the fast task cycle:

- The current execution of lower priority tasks is stopped.
- The event-triggered task or the fast task is executed.
- The interrupted task takes over again when processing of the priority task is completed.

This structure can optimize use of the processing power, and can be used to structure the application and simplify design and debugging, as it is possible to write and debug each task independently of the others.

#### Master task

This compulsory task, which executes the main program, is periodic or cyclic (see single task structures). It is activated systematically. It is intended for sequential processing. Each section can be programmed in Ladder, Structured Text or Instruction List language. One section is dedicated to Grafcet language; when this language is chosen, 3 processing operations are proposed:

■ Preliminary processing (PRE) is programmed in Ladder, Structured Text or Instruction List language and processes initializations on power return, operating mode modifications, input logic.

■ Sequential processing (CHART) includes the graphic transcription and management of Grafcet charts. It provides access to processing of the actions and transition conditions.

■ Post-processing (POST). This is programmed in Ladder, Structured Text or Instruction List language and is used to process the instructions from the 2 preceding processing operations and the indirect safety functions specific to the outputs.

#### Fast task

This task, which is higher priority than the master task, is periodic in order to leave time for execution of the lower priority task. Processing operations in this task must be as short as possible so as not to adversely affect the master task. It is useful when fast periodic changes in discrete inputs need to be monitored.

Each section of this task can be programmed in Ladder, Structured Text or Instruction List language.

#### Event triggered tasks

Unlike the tasks described above, these tasks are not linked to a period. Their execution is triggered by an event occurring in an application-specific module (eg.: overrun of a counter threshold, change in state of a discrete input). These tasks have higher priority than other tasks, and they are therefore suitable for processing operations requiring very short response times to the occurrence of an event. They can be programmed in Ladder, Structured Text or Instruction List language. **Number of EVTi control events:** 

■ TSX Micro<sup>™</sup> PLCs: 8 events with TSX<sup>™</sup> 37 10 and 16 events with TSX 37 21/22.

■ Premium<sup>™</sup> PLCs: 32 events with TSX<sup>™</sup> 57 10 and 64 events with TSX 57 20/30/40 and PCX 57 20/30.

TSX Micro TSX 37 21/22 and Premium PLCs have 2 priority levels (EVT0 event has priority over other EVTi events).

# Modicon<sup>®</sup> Premium<sup>™</sup> automation platform PL7<sup>™</sup> software

Ladder language (LD) and Structured Text language (ST)

#### Ladder language (LD)

#### Program structure (section, SR or event-triggered task)

Programs written in Ladder language consist of a series of rungs executed sequentially by the PLC. Each rung may be:

- Identified by a label.
- Completed by a comment of up to 222 characters.

A rung consists of 7 lines on TSX Micro<sup>™</sup> and 16 lines on Premium<sup>™</sup>, with 11 columns, allowing a maximum of 10 contacts and one coil per line.

#### Program editor: Ladder language

The Ladder language editor offers several tools for constructing rungs in a userfriendly way:

■ A palette of graphic elements for direct access to the various graphic symbols of the language via the mouse or the keyboard: contacts, Boolean logic, coils, operation blocks, predefined function blocks...

#### 

■ A rung can be drawn without having to fill in each element.

The language objects can be entered and displayed in either symbol or address format.

- The symbol and address of each object can be displayed simultaneously.
- A rung is constructed simply by selecting the symbol from the graphic palette and placing it in the correct position in the grid on-screen.
- An automatic link line function optimizes the number of user actions.
- The Ladder language editor is used to call up the functions which assist data entry: Access to function libraries.
- Access to the variables editor.
- Cut, copy, paste.

#### Structured Text language (ST)

Structured Text language is a sophisticated algorithmic type language which is particularly suitable for programming complex arithmetic functions, table operations, message handling, etc.

#### Program structure (section, SR or event-triggered task)

Structured Text language enables direct transcription of a flowchart analysis and is organized into statements. Each statement consists of a label (1000 labels max), comments (256 characters max) and instructions.

There are four methods for controlling statements:

- Conditional action IF.
- Conditional iterative action WHILE (action repeated while a condition is true).
- Conditional iterative action REPEAT (action repeated until a condition is true).
- Repetitive action FOR (action repeated a certain number of times).

#### Program editor: Structured Text language

The editor enables statements to be entered one after another. The editor provides help with entering:

- Modifications, insertion, etc.
- Cut, copy, paste.

Objects can be entered and displayed in either symbol or address format.

Different colors are used for the objects, language key words and program comments to make it easier to read.

# Languages (continued)

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform PL7<sup>™</sup> software

Grafcet<sup>™</sup> language (SFC)<sup>™</sup> and Instruction List language (IL)

#### Premium<sup>™</sup> PLC

- maximum of 250 steps (2) on 8 pages
- 64 macro-steps of 250 steps.
- A "generic" comment can be associated with each macro-step
- 1024 transitions maximum (2)
- 11 elements maximum per divergence/ convergence

#### 1024 steps maximum in the application

#### 96 steps maximum (2) on 8 pages for TSX 37-10 and 128 steps for TSX 37-21/22

TSX Micro<sup>™</sup> PLC

- 1024 transitions maximum (2)
- 11 elements maximum per divergence/convergence

#### Grafcet<sup>™</sup> language (SFC)

Grafcet language is used to describe, in a simple and graphic manner, the sequential part of control systems. It corresponds to the SFC "sequential function chart" language described in standard IEC 61131-3.

#### Structure of the section in the master task

Grafcet<sup>™</sup> SFC<sup>™</sup> language is only used in one section of the master task. This is structured in three processing operations, see page 6/13 of this catalog. Programs written in Grafcet SFC language consist of:

- Macro-steps (1) which are the only representation of a set of steps and a transition.
- Steps, with which the actions to be executed are associated.
- Transitions, with which the conditions are associated (transition conditions).
- Directed links, connecting the steps and transitions.

The actions (continual, pulsed on activation or deactivation) and transition conditions can be programmed in the desired language: Ladder, Structured Text or Instruction List.

#### Program editor: Grafcet SFC language

The editor offers 8 pages, each consisting of 11 columns and 14 lines, giving 154 cells per page.

A palette of graphic objects is used for direct access to each graphic symbol (macro-steps, steps, transitions, sequence selection, simultaneous activation/ deactivation and connectors).

Programming of the transition conditions and actions is performed simply by clicking on the required chart element.

On a Grafcet page, comments of up to 64 characters can be entered in any cell. Functions which assist entry: cut, copy, paste, etc. are available to the user.

#### Instruction List language (IL)

Instruction List language is a language representing, in the form of text, the equivalent of a Ladder diagram. It is used for writing Boolean equations and making use of the functions available in the language.

#### Program structure (section, SR or event-triggered tasks)

A program in Instruction List language is comprised of a sequence of instructions from the following different families:

- Bit instructions, for example read input n° 3: LD %I1.3.
- Instructions on function blocks, for example start timer n° 0: IN %TM0.
- Numerical instructions on single, double and floating point integers, for example, perform an addition: [%MW10:= %MW50 + 100].
- Instructions on word tables, character strings, for example, perform an assignment: [%MW10:10:=%KW50:10].
- Program instructions, for example, call subroutine n° 10: SR10.

Each instruction is composed of an instruction code and a bit or word type operand.

#### Program editor: Instruction List language

As in Ladder language, instructions are organized into sequences of instructions (equivalent to a rung). Each sequence of instructions can be identified by a label %Li, with i being from 0 to 999 and accompanied by a comment of 222 characters maximum.

Each sequence of instructions is composed of one or more test instructions. The result of these instructions is applied to one or more action instructions.

Objects can be entered and displayed in either symbol or address format. The editor provides help with entering data.

#### **Functions**

#### **User DFB function blocks**

Utilizing PL7<sup>™</sup> software - running on Modicon<sup>®</sup> Premium<sup>™</sup> PLCs - the user can create their own function blocks which meet the particular needs of their applications. Once they have been created and saved to the library, these function blocks can be used repeatedly with PL7<sup>™</sup> Junior/Pro software.

These user function blocks enable an application to be structured. They are used as soon as a program sequence is repeated several times in the application or to freeze a standard type of programming. They can be exported to all other PL7 applications. Using a DFB function block in one or more applications enables:

- Simplification of program entry and design.
- Improved program readability.

Easier debugging (variables handled by the DFB function block are identified on its interface).

- Use of DFB-specific internal variables (independent of the application).
- A DFB derived function block is set up in three phases:

■ Design of the DFB which has a name, parameters (I/O), variables and code in Structured Text or ladder language.

Creation of a DFB instance in the variables editor or when calling the function in the program editor.

Using this instance in the program in the same way as a standard function block.

#### Main characteristics

Inputs	16 max. (1)
Outputs	16 max. (2)
Inputs/outputs	16 max. (1) (2)
Public internal variables	1000 (can be accessed via the application program)
Private internal variables	1000 (cannot be accessed via the application program)
Comment	322 characters max.
Program sections	One section in one of the 2 languages (ST, LD).
(1) The maximum cumulative tota	l of inputs and inputs/outputs is 16.

(2) The maximum cumulative total of outputs and inputs/outputs is 16.

#### Variables editor

- The variables editor is used to:
- Symbolize the various application objects (bits, words, function blocks, I/O, ...).
- Define the parameters of the predefined function blocks (timers, counters, registers etc.).
- Enter the values of the constants and select the display base (decimal, binary, hexadecimal, floating point, message).
- Define the DFB user function block parameters.

Each symbol (32 characters max, accented characters are permitted) can be accompanied by a comment (508 characters max).

Editing services are available in the editor: Find/replace an object in a part of the program or in a set of function modules

(PL7 Pro).

Find a character string in a list of symbols or comments.

- Version ≥ V4.0 of PL7 offers enhanced functions due to:
- Copy/paste function for one or more symbol(s) and comments.

Display in plain language of the overlap of different types of variable on a single memory address (for example, single and double format internal words, %MW0/%MD0).

Highlighting of objects used by the application program.

Opening the application variable database to third-party tools by

importing/exporting text files (.txt). This new function makes it possible to create/modify application databases using a third-party software (for example TSX Microsoft Excel) that has extended edit functions.

For each numerical variable, it is possible to select the display base (decimal, binary, hexadecimal, floating point, ASCII message).

Version  $\ge$  V4.0 of PL7 offers new options for animation tables:

- Display of the comment associated with variables.
- Assignment of a single value to a number of variables.
- Change of display format for a number of variables.
- Display of the list of forced bits.

# Functions (continued)

# Modicon<sup>®</sup> Premium<sup>™</sup> automation platform PL7<sup>™</sup> software

1 081	Papira	Synbole / Nom	10.0	Valeur courante	- Nature	Table
	7xQ3.0	Temoin_demanage	1	and the other than to a the	100.000	
100	1003.1	Tempin_tempo	0

	1000					
100						

#### Animation table

Tables containing the application variables to be monitored or modified can be created by entering them or automatically initialized from the selected phrase or rung.

Variables can then be:

- Modified.
- Forced to 0 or 1 for bit objects.

For each numerical variable, it is possible to select the display base (decimal, binary, hexadecimal, floating point, ASCII message). Version ≥ V4.0 of PL7<sup>™</sup> offers new options for animation tables:

- Display of the comment associated with variables.
- Assignment of a single value to a number of variables.
- Change of display format for a number of variables.
- Display of the list of forced bits.

# al minimi tal

#### **Documentation editor**

The documentation editor is built around the Documentation Browser which displays the contents of the documentation file in a tree structure.

It can be used to print up to 100% of the application documentation file on any graphic printer which can be accessed in Windows and uses True Type technology, in A4 or US letter print formats.

The documentation editor is used to define:

- A title page, including the name of the designer and project.
- General information pages.
- A footer.

The documentation editor automatically generates:

The contents

The application documentation file: hardware and software configuration, program with its comments (including those relating to the macro-steps and subroutines).

- The list of variables sorted by address or symbol.
- The cross-references, sorted by address or symbol.

#### **Runtime screens**

The runtime screen tool is integrated in PL7<sup>™</sup> Pro software (creation and use of screens). It is intended in particular, for debugging when starting up installations and for diagnostics on detected faults or malfunctions.

It is comprised of data (explanatory texts, dynamic values, synoptics, etc.) and enables a simple and fast action (modification and dynamic monitoring of PLC variables).

The editor enables the design of these screens using the following tools:

- Screen: creation of runtime screens, which can be classed according to family.
- Message: creation of messages used.
- Objects: creation of a graphic objects library.

When the station is connected to the PLC, the user can display screens dynamically depending on the state of the process.

Screen sequencing is possible, depending on the attributed priority, via either the keyboard or PLC request.

In online mode, runtime screens enable direct access to the PL7 program from synoptics by simply clicking on the selected object.

It is also possible to activate the animation table functions or cross references once one or more variables have been selected on the screen. Version ≥ V4.0 of PL7 software also enables character string type objects to be displayed.

Synoptics can be displayed on the full screen for ease of viewing.

#### 

#### **Debugging tools**

PL7<sup>™</sup> Micro/Junior/Pro software offers a complete set of tools for debugging applications. A tool palette provides direct access to the main functions:

- Setting stop points.
- Step by step program execution.

Independent execution of the master (MAST), fast (FAST) and event-triggered (EVTi) tasks.

Debug MAST Bkpt Actif Pas à pas en cours	Ap Surv.	Mast	Fast	Evt
⊵☓⊌₿₽₽₫₡	ା <u>କ</u> 🕼 ୍ର 🖓	STEP a	Non Pr	RUN a
		J		

#### Animation of program elements

Parts of the program are animated directly when the Modicon<sup>®</sup> Premium<sup>™</sup>/TSX Micro<sup>™</sup> PLC is in the RUN rung, (Structured Text statement or sequence of instructions in Instruction List language) by activating the PL7 animation function. Animation is used to display the status of program variables, whatever the language used.

The animation can be frozen. Several windows can be displayed and animated simultaneously.

#### Animation tables

Tables containing the application variables to be monitored or modified can be created by entering them or automatically initialized from the selected program part. Variables can then be modified, forced to 0 or to 1 for bit objects.

These tables can be stored in the application and therefore retrieved at a later date.

#### **Debugging the DFBs**

■ Animation table: public parameters and variables are displayed and animated in real time. It is possible to modify and force the desired objects.

■ As for the rest of the program, it is possible to use the following functions: breakpoint, step-by-step and program diagnostics.

#### Grafcet<sup>™</sup> debugging

In online mode, the browser gives a hierarchical view of the chart with CHART module and macro-step nesting. Animation is characterized by the presence or absence of indicator colors. The Grafcet debug bar:

- Displays the state of the chart.
- Displays the state of the chart.
   Modifies the state of the chart.
- Gives information on the state of the Master task.

#### Debugging the application-specific functions

The debug screens for the application-specific functions are accessed from the I/O configuration screen by clicking on the position in which the module has been defined, when the terminal is in online mode. These screens are used for:

- Displaying and modifying the state of the I/O.
- Forcing the I/O.
- Displaying and modifying the current values.

#### Diagnostics

The debug screens provide access to the general module or channel diagnostics. These screens identify:

Detected internal module faults.

- Detected external faults from the application.
- E.g.: range detected overrun fault for an analog module.

With version ≥ V4.0 of PL7<sup>™</sup> software, the Modicon<sup>®</sup> Premium<sup>™</sup> platform system diagnostics are extended. It is possible to monitor system bits and words as well as to display associated time-stamped messages automatically, without the need for additional programming. This monitoring applies to the system elements (processor, memory, tasks), in-rack I/O and remote I/O on the Fipio<sup>®</sup> bus.

# Functions (continued)

# Modicon<sup>®</sup> Premium<sup>™</sup> automation platform PL7<sup>™</sup> software

Integrated diagnostics

#### Functions (continued)

#### Application diagnostics

PL7<sup>™</sup> Pro software has an integrated function block library containing monitoring function blocks known as Diagnostic DFBs. The Diagnostic DFB library is comprised of:

System diagnostic manufacturer blocks:

■ IO\_DIA detected input/output fault. It can be used to monitor the state of the inputs/outputs.

■ ASI\_DIA checks for the appearance of any detected errors on the AS-Interface<sup>®</sup> bus (module or detected bus fault, slave missing, slave not configured or detected errors).

Application diagnostic manufacturer blocks:

EV\_DIA checks that an event (state of a bit) takes the correct value at the expected time (no notion of time).

MV\_DIA checks the requested movement (change in the state of a bit) due to occur in a preset time period.

■ ALRM\_DIA monitors the state of a bit (at 1 or 0).

■ NEPO\_DIA and TEPO\_DIA can be used to monitor, control and diagnose the elements of the operating part created by wiring 2 preactuators and 2 sensors in conjunction.

Open diagnostic blocks:

These offer users the option of creating their own diagnostic function blocks to meet the specific requirements of their applications, thus complementing the manufacturer DFBs described above. They are created using 2 model blocks written in Ladder or Structured Text language.

The following can be created simultaneously in one application:

- a maximum of 26 types of system diagnostic DFBs
- a maximum of 26 types of application diagnostic DFBs.

#### Viewers

The diagnostic events processed by the Modicon<sup>®</sup> Premium<sup>™</sup> PLC using the diagnostic DFBs are stored in a buffer (memory space for data specific to the Premium PLC). The information contained in this PLC buffer is sent transparently for the user to the viewers and can be displayed automatically and used to handle errors and alarms. The viewer function is included as standard in:

- PL7<sup>™</sup> Pro programming software
- CCX 17 version > V 2.5 operator panels
- Magelis<sup>®</sup> XBT-F graphic terminals
- Monitor Pro<sup>™</sup> supervisor version V7.0.

The Premium platform has a multi-viewer option (link to a maximum of 15 viewers). A PC compatible station with the viewer function can be connected to several PLCs (link via X-Way<sup>™</sup> communication to a maximum of 15 Premium platforms).

This buffer/viewer structure offers:

- A single point for managing detected faults per application
- Time and date-stamping at source of the appearance of detected faults
- Memorization of detected transient faults

■ Independence from the viewer functions. The frame transmitted from the PLC buffer is identical for each viewer.

Composition of messages:

Each line displayed by the viewer represents a detected fault with, depending on the display capacity: state, type of DFB, geographical zone, dates and times of appearance/disappearance, associated message and status.

1 Viewer window on PL7<sup>™</sup> Pro screen.

6

# Functions (continued)

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform PL7<sup>™</sup> software

Variable cross-references and

Application converters

# 31.0 ITC CR

#### Variable cross-references

- For every variable, this function can be used to:
- Search for program modules where this variable is used.
- Obtain the list of statements, rungs or expressions.
- Display and check activation conditions.
- A log is used to keep track of this navigation.

Options relating to the variable, can be associated with the search (extract bit, table object, function block elements, network object, etc.).

This function can be initialized from the program or runtime screens.

#### **Application converters**

PL7™ Micro/Junior/Pro software includes application converters which make it possible to reuse in full or in part, applications already written in:

- PL7 2, applications for TSX<sup>™</sup> 17, TSX 27 or TSX 47 10/20/25 PLCs.
   PL7 3 (1), applications for TSX<sup>™</sup>/PMX 47...TSX/PMX 107 PLCs.
- ORPHEE (1), applications for April Series 1000 PLCs.

The converters offer the following utilities:

Translation of language objects into the new PL7 syntax with retrieval of associated symbols and comments.

Possibility of manually reassigning objects.

Configuration check: the tool checks whether the configuration resources required by the program to be converted are compatible with the configuration of the destination application.

- Conversion (1) with generation of source files (Ladder, Structured Text or Grafcet<sup>™</sup>) in PL7 Junior/Pro format.
- Conversion helps to ensure that instructions which are translated are functionally identical to the original program.
- A translation report gives a summary:
- $\hfill\square$  result of the conversion with the cause of non-translation where possible,
- □ correspondence of variables in PL7 with original variables.

(1) Function or functionality requiring PL7 Junior/Pro software.

# Presentation, setup

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform PL7<sup>™</sup> software

SDKC software

#### Presentation

C language function development software, also called SDKC, is a PL7<sup>™</sup> Micro, PL7<sup>™</sup> Junior and PL7<sup>™</sup> Pro software option. It enables new functions to be developed (internal code written in C language) and extends and completes the standard set of functions offered by PL7 software.

SDKC software also integrates a creation and management service for families of functions, so they can be integrated in the PL7 library.

Finally, it can be used to generate the function which helps to ensure the protection of PL7 applications by reading a signature in the PCMCIA card inserted in the PLC.

#### Setup

C language development software is a genuine tool for managing the entire function which has been created:

A user-friendly creation interface, integrated in PL7, with automatic file organisation.

Powerful debug and test tools.

Management of compatibility and software version for the functions created.

Generation of disks for the subsequent installation of functions on other development stations.

#### Management of function families

The software enables different function families to be defined. These functions, also known as EF, are classed according to family, allowing the user to create a sequential library of functions written in C language.

These functions, which will eventually form a part of the PL7 library, can be: Used in each language.

- Displayed by the PL7 library tool.
- Classed according to family/function.

The user has the following data at his disposal:

- Date of creation and generation of the function.
- The version number of the function family.

#### **Editing functions**

The various SDKC software editor tabs enable the user to create the function by: Declaring the interface (name, type and comment) for each input, output or I/O parameter.

■ Writing the source code file in C language.

Declaring the constants as separate files.

A function written in C language can access numerous internal PLC services such as real-time clock, PLC variables, system words, mathematical functions. In particular, it is possible to carry out numerical processing in floating point format, if the target PLC allows.

20

# Setup (continued), reference

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform PL7<sup>™</sup> software

SDKC software

#### Setup (continued)

#### **Debugging the functions**

The function created must be generated under the "debug" format to be tested. Once it has been inserted in an application and loaded to a PLC, the execution of a function can be checked using numerous debug tools.

A specific function debug menu in C language accesses the following services:

- Breakpoint insertion.
- Step by step execution.
- Display of code with breakpoints shown.
- Display of data manipulations.

#### Functions library enhancement

After developing, generating, then debugging the function, the last step consists of generating a function family installation disk.

This enables the function library on the user's programming terminal to be enhanced. Managing the versions allows the level of any functions installed on a station to be known at any time.

These functions can be used in each PL7<sup>™</sup> language.

#### Reference

This software extension enables standard functions offered by  $PL7^{**}$  Micro,  $PL7^{**}$  Junior and  $PL7^{**}$  Pro version > V4 software to be extended.

This software is supplied with a Microsoft Visual C++ software package registration card.

# Presentation, setup

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform PL7<sup>™</sup> software

PL7<sup>™</sup> FUZ software for fuzzy logic processing

#### Presentation

PL7<sup>™</sup> FUZ software is a PL7<sup>™</sup> TSX Micro/Junior/Pro software option enabling fuzzy logic processing in order to optimize the control of processes from TSX Micro<sup>™</sup> and Premium<sup>™</sup> PLCs. This is a software function which can be integrated in any PL7 program. It includes setup and debug tools.

This function is particularly suitable for controlling:

- Systems which are difficult to model or non-linear systems, with wide variation of inputs or an insufficient sensor resolution.
- Systems which are difficult to control and require experience and human intuition.

It enables:

- Boolean logic limits to be exceeded (true or false state).
- The representation of physical measurements by gradual concepts.
- Benefit to be gained from the expertise of operators when controlling a proces.s

The fuzzy logic function is characterized by:

5 physical measurements used as inputs (temperature, pressure, speed...).
20 graphic related functions which allow the physical measurement inputs to be

represented by predefined associated linguistic terms. A temperature will be represented for example by the terms: low, average, high according to the limits for the various terminals.

- 25 linguistic rules which determine the state to be applied to the outputs
- (3 conditions and 2 conclusions per rule).
- 4 numerical variables as outputs, results applying to the function input values
- The possibility of debugging its control offline.

Once inserted in a program, the fuzzy function can either operate in continuous mode (function executed on each scan) or on request (a single iteration on each execution). The operating mode enables the function to be used in automatic mode (calculation of the outputs depending on the state of the inputs) or in manual mode (applications with predefined output values).

Walese par dilitare	jan Rap Bre Nigodi Pede Ali Tati	] -1000		1800

#### Software setup

- The fuzzy logic function software is set up in 2 steps:
- Integration of the fuzzy function in the application program, in the same way as any other standard function.
- Setting the fuzzy function parameters using the setup screen.

#### Integration in the program

The fuzzy logic function is inserted in the program in each of the available languages. The software checks the various function parameters:

- The 5 input variables.
- The 4 output variables (plus an error bit).
- The internal variables necessary for the function to operate correctly.

The function setup screen is used to access parameters (I/O), membership functions, linguistic rules, as well as debug functions.

#### **Membership functions**

The membership functions are described intuitively using a suitable layout. A membership function is characterized by:

- The selection of one of the parameters (I/O).
- The choice of associated linguistic terms from a library of terms predefined or created by the user.
- The type of function to apply for the inputs (trapeze, triangle, etc) as well as its characteristic values and the functions to apply for the outputs (singleton).

#### Software setup (continued)

#### Linguistic rules

Linguistic rules (25 maximum) enable experts' know-how to be transcribed using conditions/conclusions such as: If...Then...

- The definition of a rule is made easier by selecting the input parameters (3 per rule).
- By assigning one of the possible linguistic terms to each input.

By defining the outputs affected by this rule (2 per rule) as well as the associated linguistic terms.

#### Simulation and debug

The fuzzy function is easily debugged using the setup and debug screen, especially simplified by the possibility of simulating the operation offline.

#### Offline simulation

Once the parameter entry screens have been completed, it is possible to perform the fuzzy function operation offline. The debug screen offers the possibility of:

- Forcing values for the various input variables.
- Starting the simulation using the "Start" key.

#### The results achieved are:

The values which will be applied to the outputs in normal operation. The percentages obtained under the various rules.

#### Debug in online mode

In online mode the debug screen enables:

- Display of the state of the I/O.
- Access to the involvement percentages obtained under the various rules.

#### It can also:

- Force the inputs for testing precise operating points.
- Change to manual mode to apply predetermined values on the outputs.
- Change the operating mode: on request, or continuously by defining a period of activation.

#### Reference

This software extension enables standard functions offered by PL7<sup>™</sup> Micro, PL7<sup>™</sup> Junior and PL7<sup>™</sup> Pro software to be extended into the domain of fuzzy logic.

# Presentation, setup

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform PL7<sup>™</sup> software

PL7<sup>™</sup> Software PL7<sup>™</sup> DIF application comparison software

#### Presentation

PL7<sup>™</sup> DIF application comparison software for Modicon<sup>®</sup> Premium<sup>™</sup> platforms is an optional program which complements the PL7<sup>™</sup> Pro programming software. It is used to compare two PL7 applications generated by PL7 Pro and automatically provide an exhaustive list of the differences between them.

The PL7 DIF program increases productivity in the main life phases of a control system based on a Premium platform:

- Application development and debugging.
- Starting up installations and processes.
- Operation and maintenance of installations and processes.

PL7 DIF software is an efficient tool for handling PL7 applications for:

- Control system design offices.
- Operation and maintenance managers.
- Installers and systems integrators.

#### Software setup

The PL7<sup>™</sup> DIF software can be used in one of two modes:

■ Interactive mode, when the comparison is launched by an operator command (double-click on the PL7<sup>™</sup> DIF software icon).

■ "Batch" mode, when it is launched by a previously established call command.

These comparison commands locate the differences between two applications in terms of:

- The hardware configuration.
- The application access protection.
- The software structure with the section validation conditions.
- The application program regardless of the language(s) used.
- The function modules.
- The code for the DFB user function blocks.
- The variables.

The result of the comparison between the two applications can be:

- Displayed.
- Printed.
- Saved in .txt format in a differences list.

#### Comparison

The end of the comparison operation is signalled by the appearance of the application browser with its three tabs.

- Identification tab for accessing the characteristics of the two applications being compared. The differences are marked by the sign #.
- 2 Browser tab for accessing the application multilevel tree structure.
- 3 List tab for accessing:
  - Printing the comparison list,
  - Creating the comparison file.

# Setup (continued), references

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform PL7<sup>™</sup> software

PL7<sup>™</sup> DIF application comparison software

### Setup (continued)

#### Display of results

The representation of the application multilevel tree structure, which can be accessed via the browser tab after launching a comparison, is annotated by 4 symbols in which the information associated with application 1 appear in blue and those associated with application 2 appear in red:

÷	This branch, found in this level of the tree structure, contains at least one difference
-#	This block contains at least one difference
1	This section is only present in application 1
2	This section is only present in application 2
<b>!</b> -	The programming language of this section differs between application 1 and application 2

In the example opposite, a difference on the rung causing changeover to manual mode is detected:

- 1 This line [7] displayed in blue belongs to application 1.
- 2 This line [7] displayed in red belongs to application 2.

The source code extracts of both applications can be used to locate the differences precisely.

#### Printing a comparison list/creating a comparison file

The list tab is the means of accessing the functions for printing a comparison list or creating a comparison file:

	Access to the list form for printing a comparison list (or creating a comparison file)
Inclure	Used to include the block selected in the tree structure in the comparison list (or the comparison file)
Exclure	Used to exclude the block selected in the tree structure of the comparison list (or the comparison file)
Constituer	Used to create the comparison list (or the comparison file) according to the selections above
Enregistrer	Starts printing the comparison list (or saving the comparison file)

## Presentation

### Modicon<sup>®</sup> Premium<sup>™</sup> automation platform PL7<sup>™</sup> software Process control

The process control range integrated as standard in Modicon<sup>®</sup> Premium<sup>™</sup> platforms enables the setup and debugging of process control loops specifically designed for machine control.

#### User-definable process control functions

TSX<sup>™</sup> P57 2e3/2e23/3e3/3623/453/4823M processors can be used, depending on the model, to manage 10 to 20 control channels (of 3 loops each). These channels can be configured in order to execute algorithms used in industrial

processes:

- Cascaded loop.
- Process loop.
- □ Autoselective loop.
- □ Setpoint programmer.
- □ Controller with three simple loops.

#### Inputs/outputs

TSX P57 2e3/2e23/3e3/3623/453/4823M processors manage an entire station consisting of racks connected on Bus X.

The I/O interfaces necessary for process control processing are analog or discrete module channels in:

In-rack I/O modules.

□ Advantys<sup>™</sup> STB or Momentum<sup>™</sup> distributed I/O modules.

#### **Control loops**

The software setup of control loops is performed by entering parameters (Plug and Play technology) when configuring the TSX P57processor.

The user completes predefined loop diagrams which also integrate management of the operating mode and the link with the I/O.

#### Operator dialog and control

Magelis® operator dialog terminals have preconfigured screens dedicated to process control which simplify loop operation and control. These screens show the controller front panels as well as trending views and monitoring views.

# Presentation, functions

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform PL7<sup>™</sup> software

Process control

#### Presentation

TSX<sup>™</sup> P57 2•3/2•23/3•3/3623/453/4823M processors can be used to configure 10, 15 or 20 continuous or semi-continuous process control channels.

- The control functions of these processors are particularly suitable for: Sequential processing requiring auxiliary control functions such as packaging
- machines, surface treatment machines, presses, etc.
- Simple processes such as metal processing furnaces, ceramic furnaces, refrigeration units. etc.
- Feedback or mechanical control where sampling time is critical, eg torque control, speed control, etc.
- Modicon<sup>®</sup> Premium<sup>™</sup> processors have, amongst others, the following characteristics:
- Each configurable control channel can be used to manage 1 to 3 loops depending on the type of loop chosen.
- Process control processors can be inserted in the overall architecture of a site as the PLC can be integrated in various communication networks.
- Calculations related to process control are performed in floating point mode, expressed as physical units.

Description: **TSX P57 ee3/ee23M** processors, see page 1/27. **Characteristics and performance**, see page 1/28.

#### **Functions**

#### **Control loops**

Modicon<sup>™</sup> Premium<sup>™</sup> processors can be used to set up 10 to 20 control channels, each one adopting one of the following 5 loop profiles:

Process loop: loop with a single controller.

■ Controller with 3 simple loops: controller which can increase the capacity of the number of loops.

Autoselective loop also known as secondary: comprised of 2 loops in parallel with an output selection algorithm.

- Cascaded loop: comprised of 2 dependent loops (the master loop output is the slave loop setpoint).
- Setpoint programmer: comprised of a maximum of 6 compound profiles with a total of 48 segments.

Since the channels are independent, configuration of 10 channels can be used to obtain:

- 30 simple loops.
- 5 setpoint programmers, each one associated with 5 control loops.
- 2 setpoint programmers and 8 process loops.
- The various loops are characterized by:
- Their different algorithms.

■ 5 processing branches (process value, setpoint, Feed Forward, loop controller and output processing).

Calculation functions (gain, filtering, square root, etc) defined using parameters.

#### Type of control loops

Predefined algorithms, whose parameters can be defined by the user, are shown below:

#### Process loop

#### Autoselective loop

#### Simple loop

#### Cascaded loop

6

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform PL7<sup>™</sup> software

Process control

#### **Processing branches**

Parameter definition (choice of functions to be used) of control loop profiles enables the algorithm to be adapted to the process to be controlled.

#### Process value processing

Process value processing can be performed either in standard fashion or externally.
 Standard processing, the user has the following functions at his disposal: filtering, process value between limits, function generator with scaling, alarm management on threshold overrun, totalizer and simulation of the measured value.

■ External processing is used to obtain, at the loop controller input, a process value, PV, which was processed outside the control loop. This solution is useful if measurement calculation of the process value requires specific or customized functions.

#### Setpoint processing

Depending on the type of loop chosen, it is possible to opt for one of the following 4 setpoints: ratio setpoint, selection setpoint, simple setpoint (remote with scaling) or setpoint programmer.

When using the controller with 3 single loops or the secondary loop (in an autoselective loop), only the simple setpoint and the setpoint programmer can be used.

#### Feed Forward processing

Feed Forward processing corrects a measurable disturbance as soon as it appears. This open loop processing anticipates the effect of the disturbance. It has the Leading function (phase lead/lag).

#### Loop controller and command processing

There are 6 different types of loop controller to choose from: autotuning PID, controller in discrete mode with 2 or 3 states, hot/cool controller (PID or autotuning model) or Split Range controller (PID or autotuning model).

#### Output processing

There are 3 types of output processing: analog output, servomotor output or PWM output. Whatever the type of output, the control calculated by the controller crosses a ramp limiter and a limiter where the lower and higher limits can be used to define the output variation range.

mbol: op Controller: op Controller 5 - SPP_1 ]	Function:	Taski * • MAST	Distributi	on of segments:

v 5349-200						
		/	1			
	1			4. 8		

#### Setpoint programmer

The setpoint programmer offers a maximum of 6 profiles with a total of 48 segments. It is therefore possible to create a 48-segment programmer, six 8-segment programmers or one 24-segment programmer with one 16-segment programmer and one 8-segment programmer, etc.

Each segment is configured as a ramp or dwell time. It is characterized by:

- The setpoint to be reached.
- Duration of the segment or gradient of the segment (if a ramp).

A profile can be executed once, a certain number of times or continually looped back. Moreover, due to the concept of specified dwell time, the time will only need to be downcounted if the process value is actually in the specified range.

## Functions (continued)

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform PL7<sup>™</sup> software

Process control

# PACK 57202 (TACK 0 POSITION 0) Consistence of the second se

#### Configuration of control channels

#### Configuration of a process loop

# PACK 52/352 [RACK 0 POSITION 0] Comparison Comparison

Defining of the cycles of profiles

#### **Configuration of control channels**

Special screens, accessible using PL7<sup>™</sup> Junior/Pro software, enable the configuration of control loops.

#### **Configuration of control channels**

By simply selecting from the menus, the "Loops" interface on PMX process control processors enables the following to be configured:

- The type of loop (out of the 5 existing ones).
- The choice of functions used in the 5 processing branches.
- Parameters linked to each function.

■ Assignment of PLC variables to different loop branches (memory words, input words or output words depending on the processing branch).

Automatic presymbolization of variables used in the loops.

Configuration of process, single, autoselective and cascaded loops proposes parameter entry by default. The various functions integrated in the algorithms (square root, function generator, etc) and the initial value of each parameter are predefined.

#### Example: configuration of process loop

Once the type of loop has been chosen, parameter entry is performed by selecting or deselecting options in the processing branches. No programming is therefore necessary, loop diagrams are enhanced or simplified as parameters are validated. The screen opposite shows how selecting the PID controller can display the various parameters valid for this type of controller (KP, TI, TD, etc).

For the setpoint programmer, configuration of the various profiles (6 maximum) is done using a table defining each segment.

Once the type of segment has been chosen (ramp or dwell time), configuration consists of defining the setpoint to be reached (for the ramp) and duration (for the ramp or dwell time).

While making selections, the lower part of the screen shows the profile display with the setpoint limit values.

This screen also allows the cycles of this profile to be defined: execution once, a certain number of times or continually looped back (32,767 times maximum).

#### **Execution of control channels**

The loop sampling period is predefined at 300 ms. This defines the loop controller processing period in automatic mode. It is possible to modify this period in the loop configuration screen.

The user can access the I/O and parameters for the various configured control channels via the program or by using the various PL7 Junior/Pro software tools (in particular language editors and animation tables).

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform PL7<sup>™</sup> software

Process control

10V

05.0 m 10 s

Adjustment and debugging of control loops is performed in a simple and user-friendly way using the loop configuration application-specific screen which, when online, can access the following functions:

- Display and animation of the loop algorithm diagram.
- Display of alarms linked to the process and detected channel faults.
- Simulation of input interface values: for example when they are not connected (process value, Feed Forward).
- Addition, removal or replacement of calculation functions in online mode.
- Modification of adjustment parameters for each function.
- Modification of loop controller operating modes and manual control.

With the controllers integrated in control loops, it is possible to use the autotuning function which calculates a set of adjustment parameters (Kp, Ti, Td or Ks, T1, T-delay) upon request.

Once the loop has been debugged, it is possible to save the current test values as the initial loop parameter values. Hence, on restarting the loop, it will contain the correct values.

#### Loop debugging

The debugging screen:

- Displays the values of variables linked to the loop dynamically.
- Shows the parameters chosen (or can even modify them).
- Displays alarms.

The menus enable manual control of the loop, autotuning, parameter backup, etc.

#### Setpoint programmer debugging

Setpoint programmer channels have their own debugging screen which displays:

- The number of the current segment and the iteration number.
- Execution time of the current segment.
- Overall execution time.

#### **Runtime screens**

The runtime screen tool available in PL7<sup>™</sup> Pro software integrates front panel views and trending views in its object library which can be used to adjust and operate control loops.

#### Front panel views and trending views

Predefined controller front panel views provide the user with the traditional appearance of controller front panels. The user only enters the variables used by the loop being dealt with in the various fields in this view.

Similarly, trending views display changes in loop parameters in graph form as well as useful operating information: operating mode, alarms, etc.

.0.0.0.0.0.0.0.0

0 h 0 m 50

#### Loop debugging

## Functions (continued)

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform PL7<sup>™</sup> software

Process control

#### **Control and operation**

Tools integrated in PL7<sup>™</sup> software (loop debugging screens, runtime screens, etc) which are associated with XBT F Magelis<sup>®</sup> graphic screen terminals offer screens dedicated to the control and operation of control loops.

#### Setup

These predefined screens offer runtime and control views.

Standard PL7<sup>™</sup> Junior/Pro software contains the application developed with XBT L1003/L1004 development software, which is comprised of predefined runtime and control views. When using this dialog application, animation of runtime and control views is automatic.

#### **Presentation of views**

Each control loop is associated with a certain number of views depending on the size of the Magelis<sup>®</sup> terminal screen.

- With 5" screen terminals, the user has 7 views at his disposal:
- monitoring view,
- □ front panel (bar chart),
- □ supervisory control view (trending),
- □ adjustment view,
- □ autotuning view,
- □ setpoint programmer view,
- □ alarm view.

With this type of terminal, it is possible to operate 8 loops.

- With 10" screen terminals, the user has 5 views at his disposal:
- monitoring view,
- □ front panel view integrating the display of the front panel, loop adjustment and autotuning,
- □ supervisory control view,
- □ setpoint programmer view,
- □ alarm view.
- With this type of terminal, it is possible to operate 16 loops.

Runtime pages are based on the same presentation module:

An alarm zone is positioned at the bottom of the screen. It shows the last active alarm.

■ Dynamic function keys execute one and only one function (access to the adjustment page, starting autotuning, navigation between the various pages, selecting a loop, etc.).

It is of course possible for the user to customize the screens to suit their specific requirements.

## Presentation

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform

Vijeo® Citect® supervisory software

Web-enabled Power & Control

Ready rent

#### Presentation

The flexibility of Vijeo® Citect® supervisory software enables users to achieve the solution that best suits their supervision requirements for installations.

Vijeo Citect offers the functions of a modern supervisor. Its distributed client-server architecture is applicable to a multitude of applications in various industries:

- Oil and Gas,
- □ MMM Mining, Metals and Minerals,
- WWW Water and Wastewater treatment,
- □ Power,

□ Food and Beverage,

Also, Vijeo Citect's flexilbility allows it to fit the requirements in many other applications like distribution facilities, airports, etc.

A unique development tool enabling the development of any supervision application, from small stand-alone systems to large distributed redundant systems.

Application designers and users benefit from the expertise of Schneider Electric in system integration. Moreover the offer is continuously updated in order to make the last technologies available to the customers.

#### Redundancy

Vijeo Citect offers total redundancy.

The redundancy functions are fully integrated within the system and are intuitive to configure.

#### **Server license**

Vijeo® Citect® exists:

□ in a **Client-Server** architecture and ranges from 75 Points to an unlimited number of Points,

□ in a **stand-alone** version called **Vijeo<sup>®</sup> Citect<sup>®</sup> Lite** that can manage 300, 600 or 1200 Points, see page 6/95.

Vijeo Citect automatically installs OFS<sup>™</sup>, the OPC server of Schneider Electric. This does not require registration. This component can only be used with Vijeo Citect software.

OFS<sup>™</sup> software provides access to any of the PLC variables: Elementary Data type, Derived Data type and Function Blocks. Furthermore OFS periodically checks the consistency between the PLC applications and SCADA application. This is a major benefit provided by Schneider Electric's extensive experience in system integration.

Server licenses **VJC 1011** •• are purchased by number of Points that are required for processing, not I/O (1). An upgrade offer **VJC 1011** 1••• is available for increasing the number of Client and Server Points if required at a later date (2).

(1) Vijeo Citect counts the variables exchanged with external devices, such as PLCs.(2) If the Server or Client is upgraded, the keys must be reprogrammed

Presentation (continued)

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform

Vijeo® Citect® supervisory software

#### **Client license**

Client licenses are generally purchased using the same Points Count as the Server to which they are connected. Four types of Clients are available:

□ Display Client, VJC 1020 ••: used by operators accessing the Vijeo<sup>®</sup> Citect<sup>®</sup> Server through a local connection,

□ **Manager** Client, VJC 1030 ••: for users needing to view the Vijeo Citect application via a local connection, but not needing to control the system,

□ Web Display Client, VJC 1022 ••: similar to Display Client but through a Web connection,

□ Web Manager Client, VJC 1032 ••: similar to Manager Client but via the Web.

#### Static, Floating and Redundant Client license

According to requirements, a Client license can either be Static, Floating or Redundant:

□ Static Client license: for operators that must have immediate access to the system, irrespective of the number of connections already established by other Clients.

A Static Client license helps to ensure permanent access to the control system since it physically resides in the key plugged into the Client PC.

□ Floating Client license: Users who need to occasionally use a Client for operator tasks can purchase Floating licenses. Connections will be allowed provided that the number of valid licenses is not exceeded. Floating Client licenses are stored on the key plugged into the Server.

□ Redundant Client license: Redundant Client licenses VJC 10● 88 are solely intended for the Standby Server in a Redundant configuration. They are used to help ensure that the number of Client licenses purchased are available.

#### Development workshop

Development workshop **VJC 1099 •2** is comprised of the physical items such as the CD-ROM, hardware keys, installation guide and storage boxes.

Set up:

- □ each Server requires a hardware key (USB or parallel) in order to operate,
- the Server key is also used to store the Floating Client licenses,
- □ the key controls the number of Points that can be used,
- □ the key is programmed to operate up to predetermined version.

#### **Promotional and Evaluation License**

A development workshop Promotional License VJC 1095 •• is available. It is only available for teaching purposes and meets requirements for demonstrations and testing.

With an Evaluation License it is possible to develop an application and test it for 10 minutes in stand-alone mode.

## Architectures

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Vijeo® Citect® supervisory software

#### **Client license**

- 1 x VJC 1032 15, Web Manager Client license for 15000 Points.

Single server architecture with 1 Web Display Client and 1 Web Manager Client

#### Networked Server system with remote Web Clients

Example: Networked Server system, 500 Points, with 2 remote Clients via the Web: one Web Display and one Web Manager.

#### **Development workshop**

- 1 x VJC 1099 22, physical delivery of the CD with USB key.

#### Server license

- 1 x VJC 1011 12, Server license for 500 Points, including Server Client.

#### **Client licenses**

- 1 x VJC 1022 12, Web Display Client license for 500 Points.
- 1 x VJC 1032 12, Web Manager Client license for 500 Points.

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform

Vijeo® Citect® supervisory software

Single server architecture with 2 Floating Display Client licenses and 1 Static license

#### Architectures (continued)

#### Networked server system with floating and static access

Example: Networked Server system, 5000 Points, with 5 Client PCs and 3 Client licenses, including 2 Floating licenses and 1 Static license.

#### **Development workshop**

- 1 x VJC 1099 22, physical delivery of the CD with USB key.
- 1 x VJC 1099 21, additional USB key for Static Client.

#### Server license

- 1 x VJC 1011 14, Server license for 5000 Points, including Client Server (local Display Client type on the Server PC).

#### **Client licenses**

- 3 x VJC 1020 14, Display Client licenses for 5000 Points.

Redundant architecture with 2 Display Clients on servers and 2 Web Manager Clients

#### Redundant server with Server Display Clients and Web Manager Clients

Example: Redundant server, 1500 Points, with 2 Display Clients on the Servers and 2 Web Manager Clients.

#### **Development workshop**

- 1 x VJC 1099 22, physical delivery of the CD with USB key: Primary server key.
- 1 x VJC 1099 21, additional USB key for Standby Server (rule: 1 key per Server).

#### Server licenses

- 2 x VJC 1011 13, Server licenses for 1500 Points, including Server Client.
   the first Server acts as the Primary Server,
- □ the second Server acts as the Standby Server,
- □ one license will be placed on each key (Primary and Standby).

#### **Client licenses**

- 2 x VJC 1032 13, Web Manager Client licenses for 1500 Points. □ these 2 licenses will be placed on the Primary Server key.

#### Redundant Client license:

- 2 x VJC 1032 88, Redundant Web Manager Client licenses
- In floating Redundant licenses for Web Manager Client licenses,
- □ these 2 licenses will be placed on the Standby Server key.

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Vijeo<sup>®</sup> Citect<sup>®</sup> supervisory software

Vijeo<sup>®</sup> Citect<sup>®</sup> - Specific drivers

The Vijeo Citect offer includes an extensive number of drivers as standard. However, for copyright reasons, some drivers have a specific reference and they must be ordered separately.

Purchasing a specific driver includes access to the appropriate technical support for the driver for one year.

Description	Protocol	Reference	Weight kg
Vijeo Citect specific driver	IEC 60870-5-104	VJC 3051 41	-
	PSDirect ETH	VJC 3051 40	_
	PSDirect MPI	VJC 3051 42	_
	Bailey	VJC 3051 44	_
	SEMAPI	VJC 3051 48	_
	MOSCAD	VJC 3051 49	_

**Note:** Before ordering a Vijeo Citect specific driver, please consult your Schneider Electric Regional Sales Office.

#### Vijeo Citect - Key reprogramming

Any reprogramming of the Vijeo Citect key is subject to order reference VJC 1094 00:

- □ upgrading the number of Points,
- □ adding Clients,
- upgrading a Vijeo Citect Lite license to a full Vijeo Citect license,
- exchanging a parallel key for a USB key.

Note: If a new key is required, purchase an additional Vijeo Citect key, see page 36375/6.

Description	Reference	Weight kg
Vijeo Citect Key reprogramming	VJC 1094 00	-

#### Vijeo Citect Support

From the second year of ownership of one or more Vijeo Citect licenses, Vijeo Citect Support enables the user to continue receiving the benefits of full support for the installed base. One of the services included in this offer is the supply of the latest version updates.

Description	Details	Reference	Weight kg
Support	For Vijeo Citect software and licenses	VJC 1091 01	_
	For Vijeo Citect specific drivers	VJC 1091 01D3	-

#### Third-party applications converter

Switch 2 Vijeo Citect<sup>™</sup> is a conversion tool that helps to convert legacy SCADA to Vijeo Citect. Its allows the tag database and graphic information to be reproduced inside Vijeo Citect. The conversion rate depends upon the complexity of the application and can vary from 15 % to 80 %.

Vijeo Citect Loan key			
Description	Details	Reference	Weight kg
Vijeo Citect Loan key USB key only (1)	Provides temporary access to a key (2). 8 days continuous usage. The hardware key must be returned at the end of the loan period.	VJC 1095 03	_

(1) Also requires an "additional USB key" VJC 1099 21.

(2) The quantity to be ordered equals the number of months of the required loan period.

## Presentation

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform OPC<sup>®</sup> Standard

OPC Factory Server (OFS)<sup>™</sup> software

Web-enabled Power & Control

#### Presentation

Schneider Electric's OPC Factory Server (OFS)<sup>™</sup> software is based on the OLE for Process Control (OPC <sup>™</sup>) standard. It allows "client" software applications, such as supervisors/SCADA and customized interfaces - to access the data of Schneider Electric's automation systems and electrical distribution devices - by connecting to networks or field bus in real time.

It also allows communication with third party devices supporting Modbus® and Modbus®/TCP protocols.

At the heart of the Schneider Electric Transparent Ready<sup>®</sup> offer, OFS <sup>™</sup> enables simpler, more open and transparent communication between your software applications and your devices. These are just some of the advantages that help to ensure a complete, interoperable solution that is central to your process.

In version V3.3, the OFS<sup>™</sup> data server integrates the most recent specifications of the OPC<sup>®</sup> Foundation:

- OPC-DA (OPC Data Access)
- .NET API interface
- OPC XML-DA V1.0 (OPC XML Data Access)

The OFS<sup>™</sup> V3.3 offer is available in two levels:

■ OFS Small: data server for 1000 items (1) that does not support the

- OPC XML-DA protocol
- OFS Large: complete server data

#### **Devices and protocols supported**

OFS<sup>™</sup> software is a multi-device data server: it allows simultaneous use of several communication protocols, and it provides client applications with a set of services for accessing automation system items that may be local or remote, via physical address or via symbol.

#### Devices supported:

- Modicon<sup>®</sup> Premium<sup>™</sup>, Quantum<sup>™</sup>, TSX Micro<sup>™</sup>, Compact<sup>™</sup>, and Momentum<sup>™</sup> PLCs
- TSX<sup>™</sup> Series 7 and April Series 1000 Schneider Electric PLCs
- Serial Modbus<sup>®</sup> devices connected via Schneider Electric gateways:
- TSX<sup>™</sup> ETG 10●●, EGX ●●● ranges, etc.
- Serial Uni-Telway<sup>™</sup> devices connected via Schneider Electric gateways (TSX ETG 1010)

#### Networks and protocols supported:

- Modbus<sup>®</sup>: Modbus serial, Modbus Plus<sup>™</sup>, Modbus/TCP
- X-Way<sup>™</sup>, UNI-TE<sup>™</sup>, Uni-Telway<sup>™</sup>, Fipway<sup>®</sup>, Ethway<sup>™</sup>, ISAway<sup>™</sup>, PCIway<sup>™</sup>

#### Openness

The development of specialized interfaces is simpler with OFS<sup>™</sup> V3.3 software, aimed at two types of user in particular:

■ End users who either want to interface their supervision or human/machine interface applications with Schneider Electric equipment or to develop applications on a PC (supervisory control screens, Excel tables, etc.) requiring access to automation system data.

■ Suppliers of automation system or industrial data processing software (supervision, human/machine interfaces, etc.) seeking to develop, within their standard products, an OPC Client interface capable of accessing data in Schneider Electric equipment via the OFS server.

(1) item: variable, structure, table, etc. of the Unity Pro application.

## Presentation (continued)

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform OPC<sup>®</sup> Standard

OPC Factory Server (OFS)<sup>™</sup> software

OPC Factory Server<sup>™</sup>: home page

#### Architectures supported

- The OFS<sup>™</sup> server allows four access modes:
- a purely local mode
- remote access from an OPC-DA client
- remote access from an OPC .NET client
- remote access from an OPC XML-DA client

#### Local access

The client application and the OFS server are on the same PC.

#### Remote access from an OPC-DA client

The client application and the OFS<sup>™</sup> data server are on remote stations. Communication between the client station and the OFS server is conducted through the DCOM layer (Microsoft) via the OPC-DA protocol.

## Presentation (continued)

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform OPC<sup>®</sup> Standard

OPC Standard OPC Factory Server (OFS)<sup>™</sup> software

#### Supported architectures (continued)

Remote access from an OPC .NET client

The .NET<sup>®</sup> client application program and the OFS<sup>™</sup> data server are on remote stations. Communication between the client station and the OFS server is conducted through the DCOM layer (Microsoft) via the OPC-DA protocol.

The .NET Microsoft compatibility of the OFS server has been developed to allow an OPC .NET client to access OFS server items on an Intranet network via the OPC .NETAPI interface.

This interface helps to ensure interoperability between existing OPC applications and applications developed in the native .NET environment

#### Remote access from an OPC XML-DA client via HTTP

The client application program and the OFS server are on remote stations, using the SOAP protocol to communicate via the Internet in conformity with the OPC XML-DA V1.01 specification of the OPC Foundation.

The OFS data server is based on an HTTP server installed on the same station.

The OPC XML-DA V1.0 specifications are designed to overcome the limitations of COM/DCOM by providing:

- an OPC interface for Windows and non Windows client applications
- beyond the Intranet perimeter, remote access via the Internet through firewalls.

The OPC XML-DA specification is based on "Web Services" standards such as SOAP, XML, WSDL (1). A SOAP client can access data on the OFS server via Intranet or Internet using the SOAP protocol in conformity with the OPC XML DA V1.01 specification of the OPC foundation.

XML: Extended Markup Language

WSDL: Web Services Description Language

<sup>(1)</sup> SOAP: Simple Object Access Protocol

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform OPC<sup>®</sup> Standard

OPC Factory Server (OFS)<sup>™</sup> software

server

#### The OFS<sup>T</sup> server **1** is the center of the data exchanges.

The direct and dynamic link 2 between the OFS server and the Unity<sup>™</sup> Pro project station results in productivity gains for designers and users of the devices. Effectively, OFS has direct access to the items in the Unity Pro project. In addition, it performs a consistency check between these items and those of the Modicon<sup>®</sup> Premium<sup>™</sup> and Quantum<sup>™</sup> PLCs.

Note: Depending on the software used for setting-up Modicon PLCs:

- PL7 software generates PLC variable symbol export files. These export files (symbols.scy) must be integrated in the OPC server.
- Concept: the variables can be accessed directly in the project (file.prj) of the Concept application. This direct link requires Concept (version > 2.0) to be installed on the OFS station 1
   If the Unity Pro project development station is not accessible via the OFS station, the PLC variable symbol export files (symbols.xvm) generated by Unity Pro must be integrated in the OPC

**Functions** 

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform OPC<sup>®</sup> Standard

OPC Factory Server (OFS)<sup>™</sup> software

#### Functions

#### **Development of client applications**

OFS<sup>™</sup> software has 4 types of interface:

#### OLE Automation interface (OPC-DA)

Particularly suitable for end users, it enables the development of OPC client applications in Visual Basic<sup>®</sup>, in Visual Basic for Excel, and in C++.

#### OLE Custom interface (OPC-DA)

Used primarily by suppliers of automation system or industrial IT products, it enables the development of applications in C++ in order to access the OFS<sup>™</sup> software OPC server. This interface is particularly aimed at software development experts, so that they can integrate the client application in their standard products. This is the interface with the highest performance, in terms of access time to data stored in the OPC server. It requires extensive knowledge of C++ programming to set up.

#### OPC .NET API wrapper interface

The .NET Microsoft compatibility of the OFS data server gives an OPC .NET client native access to items of the OFS server via an Intranet network, helping to ensure greater interoperability with native .NET environments.

**Note:** In this case, communication between the OPC .NET client and the OFS server is conducted through the DCOM layer (or COM layer in a local configuration) via the OPC-DA protocol.

#### ■ OPC XML-DA interface (1)

The OPC XML-DA V1.0 specifications are designed to overcome the limitations of the OPC-DA specification and COM/DCOM by providing:

an interface for Windows and non Windows client applications
remote access via the Internet through firewalls (beyond the Intranet perimeter).

The OPC XML-DA specification is based on Web Services standards such as SOAP, XML, WSDL. A SOAP client can access data on the OFS server via Intranet or Internet using the SOAP protocol in conformity with the OPC XML-DA V1.01 specification of the OPC Foundation.

(1) Only available with the Large version of OPC Factory Server V3.3

## References

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform OPC<sup>®</sup> Standard

OPC Factory Server (OFS)<sup>™</sup> software

#### References

OFS<sup>™</sup> V3.3 software for PC compatible stations (minimum configuration: Pentium<sup>®</sup> 566 MHz processor, 128 MB RAM) running Windows 2000<sup>®</sup> Professional (1) or Windows XP<sup>®</sup> Professional.

The OFS V3.3 offer includes:

- OPC server software
- OPC server simulator (for debugging the application when no PLC is present)
- OFS server configuration software
- An example of OPC client for setting-up applications
- The set up documentation on CD-ROM

Supplied on CD-ROM, the software operates independently on a PC. It interfaces with the variables export files generated by  $PL7^{\mathbb{M}}$ ,  $ProWORX^{\mathbb{M}}$ ,  $Concept^{\mathbb{M}}$  and  $Unity^{\mathbb{M}}$  Pro software.

It also provides a direct and dynamic link to the Unity Pro and Concept applications (2).

OFS V3.3 software is available in two versions:

- Small version TLX CD SeOFS 33
- Maximum of 1000 items
- $\hfill\square$  Only the OPC XML-DA protocol is not supported.
- □ Single station and 10-station site licenses
- Large version TLX CD L●OFS 33

### Presentation

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform

Connection interfaces Advantys<sup>™</sup> Telefast<sup>®</sup> ABE 7 pre-wired system Premium connection cables

1 I/O modules equipped with HE 10 connectors. The modular sizes available are 16, 32 and 64 I/O.

2 A single type of cable equipped with 20-way HE 10 connectors, irrespective of the 8, 12 or 16-channel modularity. The HE 10 connectors may be moulded, **TSX<sup>™</sup> CDP** (AWG 22) or insulation piercing, **ABF H20Heee** (AWG 28).

These cables are available in 0.5, 1, 2, 3 and 5 meter lengths. AWG 28 gauge (0.08 mm<sup>2</sup>) enables 100 mA input and output sub-bases to be connected directly, as well as sub-bases equipped with relays. The **ABE 7ACC02** splitter sub-base is used to connect 8-channel sub-bases.

- 3 Analog signal connections are made using a **TSX<sup>™</sup> CAP030** pre-wired cable fitted with 25-way SUB-D connectors help to ensure the continuity of the shielding.
- 4 There are several types of sub-bases for counter and analog channels:
  - ABE 7CPA02 for connecting current, voltage or PT100 inputs to screw terminal blocks,
  - ABE 7CPA03 with 4-20 mA sensor loop supply and 25 mA limiter for each channel,
  - ABE 7CPA21 for connecting 4-channel analog output modules to screw terminal blocks,
  - ABE 7CPA31 with isolated 4-20 mA sensor loop supply for 8 individually isolated input channels,
  - ABE 7CPA11 for connecting an absolute encoder with parallel outputs,
  - ABE 7CPA12 for connecting 16 thermocouple probes.
- 5 16-channel Advantys<sup>™</sup> Telefast<sup>®</sup> ABE 7 sub-bases.
- 6 Splitter sub-bases for the parallel connection of discrete I/O from a Advantys Telefast ABE 7 sub-base to 2 different PLCs:
  - ABE 7ACC10 for output redundancy,
  - ABE 7ACC11 for input redundancy.

(1) The ---- 24 V power supply is connected using Telefast 2 sub-bases only. The ---- 0 V connections must be equipotential.

#### Schneider Gelectric

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform

Power supplies and transformers Phaseo<sup>®</sup> Universal range switch mode power supplies for DC control circuits

ABL 8RPS24050

Modicon® M340™ automation platform

#### Switch mode power supplies: Universal range

The ABL 8RPS/RPM/WPS power supply offer is designed to provide the DC voltage necessary for the control circuits of automation system equipment. Comprising six products, this range meets the needs encountered in industrial and commercial applications. These compact electronic switch mode power supplies provide a quality of output current that is suitable for the loads supplied and compatible with Modicon® Premium<sup>™</sup>, Quantum<sup>™</sup> and M340<sup>™</sup> PLCs. When used with additional function modules, they help to ensure continuity of service in the event of network power outages or application malfunctions. Clear guidelines are given on selecting the function modules and upstream protection devices which are often used with them, and thus a comprehensive solution is provided.

The Universal range of Phaseo<sup>®</sup> power supplies must be connected in phase-to-neutral or phase-to-phase for ABL 8RPS/RPM, and in three-phase for ABL 8WPS. They deliver a voltage that is precise to 3%, whatever the load and whatever the type of line supply, within the ranges:  $\square$  85 to 132 V  $\sim$  and 170 to 550 V  $\sim$  for ABL 8RPS  $\square$  85 to 132 V  $\sim$  and 170 to 264 V  $\sim$  for ABL 8RPM

 $\square$  340 to 550 V  $\sim$  for ABL 8WPS

Their very wide input voltage range allows a considerable reduction of parts held in stock and offers a distinct advantage in terms of machine design.

Conforming to IEC standards and UL and CSA certified, they are suitable for universal use.

ABL 8RPS/RPM and ABL 8WPS power supplies are equipped with a harmonic filter, helping to ensure compliance with standard IEC/EN 61000-3-2 concerning harmonic pollution.

The Universal range of Phaseo<sup>®</sup> power supplies have protection devices to help ensure optimum performance of the automation system. Their operating mode can be configured as required by the user:

**Manual reset protection mode:** Priority is given to the voltage so as to help maintain the PLC logic states and nominal operation of the supplied actuators. **Automatic reset protection mode:** Priority is given to the current to allow troubleshooting for example, or to help ensure continuity of service until the arrival of the maintenance team.

The Universal range of Phaseo® power supplies also has a power reserve, allowing them to deliver a current of 1.5 In at regular intervals. This avoids the need to oversize the power supply if the device has a high inrush current, while helping to ensure optimum performance of the automation system.

The diagnostics for the Universal range of Phaseo power supplies are available on the front of the device via LEDs ( $U_{out}$  and  $I_{out}$ ) and via a volt-free relay contact.

Products are equipped with an output voltage adjustment potentiometer in order to be able to compensate for any line voltage drops in installations with long connection cable runs.

These power supplies are designed for direct mounting on a 35 mm DIN rail.

## Presentation (continued), description

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform

Power supplies and transformers Phaseo<sup>®</sup> Universal range switch mode power supplies for DC control circuits

Modicon<sup>®</sup> Premium™ automation platform

#### Switch mode power supplies: Universal range (continued)

There are four references available supplies for phase-to-neutral or pha	0		wer
ABL 8RPS24030	72 W	3 A	24 V
ABL 8RPS24050	120 W	5 A	24 V ===
ABL 8RPS24100	240 W	10 A	24 V ===
ABL 8RPM24200	480 W	20 A	24 V

The Universal range of Phaseo® power supplies also features two references for three-phase connection:

ABL 8WPS24200	480 W	20 A	24 V
ABL 8WPS24400	960 W	40 A	24 V

A range of function modules also allows functions to be added to the Universal range of Phaseo power supplies so as to help ensure continuity of service:

□ A Buffer module or Battery control modules combined with their batteries to help ensure continuity of service in the event of a network power outage

□ A Redundancy module to meet the most demanding requirements for continuity of service even if the power supply becomes inoperative

Downstream electronic Protection modules to help ensure that the protection in the application is discriminating

□ Converter modules delivering nominal voltages of 5 and 12 V --- from the 24 V ---- output of the Universal range of Phaseo power supplies

#### **Description**

#### Universal range of power supplies

The Universal range of Phaseo® regulated switch mode power supplies, **ABL 8RPS24ee0/RPM24200/WPS24e00**, is comprised of:

- 1 Spring clip for 35 mm DIN rail
- 2 4 mm<sup>2</sup> enclosed screw terminals for connection of the AC voltage (single-phase, phase-to-phase or three-phase connection)
- 3 Protective glass flap
- 4 Clip-on marker label
- 5 Locking catch for the glass flap (sealable)
- 6 Protection mode selector
- 7 Output voltage adjustment potentiometer
- 8 Output voltage status LED (green and red)
- 9 Output current status LED (green, red and orange)
- 10 Screw terminals for connection of the diagnostic relay contact, except ABL 8RPS24030
- 11 4 mm<sup>2</sup> (10 mm<sup>2</sup> on ABL 8WPS24•00 and ABL 8RPM24200) enclosed screw terminals for connection of the DC output voltage

### **Characteristics**

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Power supplies and transformers Phaseo® Universal range switch mode power supplies

for DC control circuits

Technical charac			ABL 8RPS24030	ABL 8RPS24050	ABL 8RPS24100	ABL 8RPM24200	
Type of power supply Certifications						ADL ORPWIZ4200	
	Cofet:		CB scheme EN 60950-1, UL, cCSAus, C-Tick, C€				
Conformity to standards			IEC/EN 60950-1, EN 61204, SELV EN 61000-6-1, IEC/EN 61000-6-2, EN 61000-6-3, IEC/EN 61000-6-4.				
	EMC		IEC/EN 61204-3	/EIN 0 1000-0-2, EIN 0 I	000-0-3, IEC/EN 0100	JU-0-4,	
Input circuit			120/211012010

### **Output characteristics**

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform

Power supplies and transformers Phaseo<sup>®</sup> Universal range switch mode power supplies for DC control circuits

#### **Output characteristics**

#### Derating

The ambient temperature is a determining factor that limits the power an electronic power supply can deliver continuously. If the temperature around the electronic components is too high, their life will be significantly reduced.

The nominal ambient temperature for the Universal range of Phaseo<sup>®</sup> power supplies is 50°C. Above this temperature, derating is necessary up to a maximum temperature of 60°C.

The graph below shows the power (in relation to the nominal power) that the power supply can deliver continuously, depending on the ambient temperature.

#### ABL 8RPM, ABL 8RPS, ABL 8WPS mounted vertically

Derating should be considered in extreme operating conditions: □ Intensive operation (output current permanently close to the nominal current, combined with a high ambient temperature)

- Output voltage set above 24V (to compensate for line voltage drops, for example)
- Parallel connection to increase the total power

Ochici al l'alco to k	
Intensive operation	See derating on above graph. Example for ABL 8RPS: - Without derating, from 0°C to 50°C - Derating of nominal current by 2%, per additional °C, up to 60°C
Rise in output voltage	The nominal power is fixed. Increasing the output voltage means that the current delivered must be reduced.
Mounting	To allow heat dissipation, the power supplies must not be in contact with each other.

There must be adequate convection around the products to assist cooling. There must be sufficient clearance around the Universal range of Phaseo<sup>®</sup> power supplies: □ 50 mm above and below

□ 10 mm on the sides

#### Output characteristics (continued)

## Modicon<sup>®</sup> Premium<sup>™</sup> automation platform

Power supplies and transformers Phaseo<sup>®</sup> Universal range switch mode power supplies for DC control circuits

#### Output characteristics (continued)

#### Behavior in the event of overloads

#### Behavior in the event of overloads:

Automatic reset protection mode (current limiting): If the output current exceeds approximately 1.2 In, the output current is limited to this value. The value of the output voltage can then be less than 21 V but the diagnostic relay opens, allowing the anomaly to be fed back to the automation system and thus prevent feedback of any undefined logic state. On elimination of the overload, the output voltage reverts to its preset value.

**Manual reset protection mode (undervoltage detection):** If the output current exceeds approximately 1.2 In, the power supply stops completely before the output voltage drops below 21 V and no longer delivers any current. The detected fault is memorized as long as voltage is present at the power supply primary. The power supply will become operational again, if the detected fault has disappeared, after de-energizing the primary for a few seconds.

**Note:** In both these modes, any overload of less than 1.5 In and lasting less than 4 s will be absorbed by the "boost" circuit and the voltage delivered will stay within the specified limits (adjustment voltage +/- 3%).

#### Load limit

Manual reset protection mode
ABL 8RPM24200/ABL 8RPS24eee/ABL 8WPS24eee

## Automatic reset protection mode ABL 8RPM24200/ABL 8RPS2400/ABL 8WPS2400

#### "Boost" repeat accuracy

The **ABL 8RPS/RPM/WPS** Universal range of Phaseo<sup>®</sup> power supplies has a power reserve, allowing them to supply the application with energy up to 1.5 times the nominal current at the intervals illustrated by the graph opposite.

The "boost" amplitude and repeat accuracy depend on:

- □ The overload duration
- The overload intensity
- □ The period between each consumption peak

When the power supply can no longer cope (repeated overloads, overload duration > 4 seconds, power rating > 150% of nominal power) the integrated protection trips.

This type of operation is described in detail in the user manual, which can be downloaded from our website, <u>www.schneider-electric.com</u>.

#### Behavior in the event of phase failure on three-phase power supplies

The **ABL 8WPS24e00** Universal range of Phaseo® power supplies is capable of starting and delivering a nominal current and voltage for a few minutes in the event of failure of one phase. Their protection (thermal) then trips and they are reset automatically.

### Output characteristics (continued), selection, schemes

## Presentation

# Modicon<sup>®</sup> Premium<sup>™</sup> automation platform

Power supplies and transformers Phaseo<sup>®</sup> AS-Interface<sup>®</sup> range switch mode power supplies

#### Power supplies for AS-Interface® cabling system

Consistent with the standard Phaseo<sup>®</sup> line, the range of **ASI ABL** power supplies is designed to deliver a --- voltage, as required by AS-Interface<sup>®</sup> cabling systems. Three versions are available to meet the needs encountered in industrial applications, in enclosures, cells or floor-standing enclosures. These single-phase, electronic, switch mode power supplies help to ensure the quality of the output current, in accordance with the electrical characteristics and conforming to standard EN 50295.

#### ASI ABLB300.

Operating on a 100 to 240 V  $\sim$  supply, this power supply delivers a voltage of 30 V  $\dots$ . Available in 2.4 and 4.8 A ratings, the outgoing terminal block allows the cable to be connected separately to the AS-Interface interface modules and to the AS-Interface master. Input and output LEDs allow fast and continuous diagnostics.

ASI ABLB3002

ASI ABLD 3004

ASI ABLM3024

#### ASI ABLD300.

Operating on a 100 to 240 V  $\sim$  supply, this power supply delivers a voltage of 30 V .... Available in 2.4 and 4.8 A ratings, it allows diagnosis and management of detected ground faults on AS-Interface interface modules. In the event of a detected ground fault, the Phaseo® power supply stops dialog on the AS-Interface® cabling system and puts the installation in a fallback condition. Restarting is only possible after deliberate acknowledgement of the detected fault. Two inputs/outputs enable dialog with a processing unit. The outgoing terminal block is used to connect the AS-Interface® cable separately to the interface modules and master modules. Input, output and detected ground fault LED's allow fast and continuous diagnostics.

#### ASI ABLM3024

Operating on a 100 to 240 V  $\sim$  supply, this product provides two separate power supplies, which are totally independent in the way they operate. Two output voltages - 30 V/2.4 A (AS-Interface<sup>®</sup> line supply) and 24 V/3 A - are available, so making it possible to supply the control equipment without an additional power supply. Input and output LEDs allow fast and continuous diagnostics.

#### **Output characteristics**

#### Derating

The ambient temperature is a determining factor which limits the power that an electronic power supply can deliver continuously. If the temperature around the electronic components is too high, their life will be significantly reduced. The graph below shows the power (in relation to the nominal power) which the power supply can deliver continuously, according to the ambient temperature.

#### **Function diagram**

(1) 30 ms min. (2) 15 ms. (2) 20 ms. (4) Warning: the ground fault detector will only operate if the ground (GND) terminal is

(4) warning: the ground fault detector will only operate if the ground (GND) terminal is connected.

#### **A** Warning

■ The ground (GND) (4) connection must be made. In the event of disconnection, the built-in detector becomes inoperative. To obtain ground connection diagnostics, it is recommended that an ASI ABLD300• power supply be used with built-in insulation control.

• The appearence of a ground fault will trigger, in the following cases, the activationg of built-in protection:

- □ **case 1**: detected fault between AS-i "+" and ground,
- □ **case 2**: detected fault between AS-i "-" and ground,

□ case 3: detected fault between sensors/actuators (supplied by ASI ABLD300●) and ground.

In cases 1 and 2 with switch 1 ON -> OFF: maintain of fault, any exchange between master and slaves.

In case 3 with switch 1 ON -> OFF: restart of exchanges between master and slaves but the states of inputs/outputs of affected module may not be correct.

### Modicon<sup>®</sup> Premium<sup>™</sup> automation platform

Treatment for severe environments Conformal coating modules

#### Presentation

#### Protective treatment of Modicon® Premium<sup>™</sup> platforms

The Modicon<sup>®</sup> Premium<sup>™</sup> automation platform meets the requirements of "**TC**" treatment (**T**reatment for all **C**limates).

For installations in industrial production workshops or environments corresponding to "TH" treatment (Treatment for hot and Humid environments), Modicon Premium PLCs must be embedded in envelopes with a minimum IP 54 protection, in compliance with IEC/EN 60529 or equivalent level according to NEMA 250.

Modicon Premium PLCs themselves offer **protection to IP 20 level** and **protection against pins** (encloset equipement) (1). They can therefore be installed without an envelope in reserved-access areas which do not exceed **pollution level 2** (control room with no dust-producing machine or activity). The pollution level 2 does not take account of more severe environmental conditions: air pollution by dust, smoke, corrosive or radioactive particles, vapours or salts, attack by fungi, insects, ...

#### Treatement for environments more severe

If the Modicon<sup>®</sup> Premium<sup>™</sup> PLC needs to be used in an environment more severe than the specified characteristics, it's possible to get processor and power supply modules, I/O modules on bus X and racks with a Conformal Coated protection:**Humiseal 1A33** type coated on electronic cards.

The Conformal Coated protection increases the isolation capability of the treated circuit board like their resistance to:

condensation

□ dusty atmosphere (conducting foreign particles)

□ corrosion more particularly at the time of a use in sulfur atmosphere (oil refinery, purification plant,...) or halogens atmosphere (chlorine, ...).

These protection, associated with the appropriate intallation and maintenance allows to use the Modicon Premium products in the hard chemical environment like **3C2** and **3C3 types** according to IEC/EN 60721-3-3.

The functional and electrical characteristics of these modules are the same as the characteristics of their standard equivalent modules. Please, consult the characteristics pages in chapter 1 to chapter 5.

To order a Conformal Coating modules and racks, see pages 9/3 to 9/5 ("C" added at the end of the standard reference).

<sup>(1)</sup> In the case where a position is not occupied by a Premium<sup>™</sup> module, a **TSX<sup>™</sup> RKA 02** protective cover must be installed (sold in lots of 5).

Module selector (can be photocopied)

# Modicon<sup>®</sup> Premium<sup>™</sup> automation platform TSX<sup>™</sup> PSY Power Supply

The power required to supply each TSX<sup>™</sup> RKY rack depends on the type and number of modules installed. It is therefore necessary to create a power consumption table for each rack in order to define the most suitable TSX<sup>™</sup> PSY power supply module for each rack. The table below can be used to calculate the consumption on the three different voltages to be supplied (--- 5 V, --- 24 V, --- 24 VR). Procedure :

• Check and choose a power supply module corresponding to the power supplies available for the 3 voltages.

Check that the total power absorbed on these three voltages does not exceed the overall power of the power supply module. Values to be entered according to the type of Modicon<sup>®</sup> Premium<sup>™</sup> PLC configuration.

### Modicon<sup>®</sup> Premium<sup>™</sup> automation platform

Standards, certifications and environment / conditions

#### Standards and certifications

Modicon® Premium<sup>™</sup> PLCs have been developed to conform to the principal national and international standards concerning electronic equipment for industrial automation systems.

- Requirements specific to programmable controllers: functional characteristics,
- immunity, resistance, safety, etc.: IEC/EN 61131-2, CSA 22.2 N° 142, UL 508.
- Merchant navy requirements of the main international bodies: ABS, BV, DNV, GL, LR, RINA, RMRS, etc.
- Compliance with European Directives:
- □ Low Voltage: 73/23/EEC amendment 93/68/EEC,
- □ Electromagnetic Compatibility: 89/336/EEC amendments 92/31/EEC
- and 93/68/EEC.
- Electrical qualities and self-extinguishing capacity of insulating materials: UL 746C, UL 94.
- Hazardous areas calssification: CSA 22.2 No. 213, Class I, Division 2, Groups A, B, C and D.

#### Protective treatment of Modicon<sup>®</sup> Premium<sup>®</sup> PLCs

Modicon<sup>®</sup> Premium<sup>™</sup> PLCs meet the requirements of "TC" treatment (*Treatment for* all Climates).

For installations in industrial production workshops or environments corresponding to "TH" treatment (treatment for hot and humid environments), Premium PLCs must be embedded in envelopes with a minimum IP 54 protection, in compliance with IEC/EN 60664 and NF C20-040.

Premium<sup>™</sup> PLCs themselves offer protection to IP 20 level (1). They can therefore be installed without an envelope in reserved-access areas which do not exceed pollution level 2 (control room with no dust-producing machine or activity). The pollution level 2 does not take account of more severe environmental conditions: air pollution by dust, smoke, corrosive or radioactive particles, vapours or salts, attack by fungi, insects, ...

If the control system needs to operate in a corrosive environment, some of then Premium modules and racks can be ordered with a conformal applied to the cover and bezel. See page 9/2.

(1) TSX P57 0244/104/154M and TSX P57 454/4634/554/5634/6634M: 0...+ 57 °C or 0...67 °C with TSX™ FAN●●P fan modules when some of then I/O modules are insert adjacent to above processors.

<sup>9</sup> 

<sup>(2)</sup> In the case where a position is not occupied by a module, a TSX™ RKA 02 protection cover must be installed

### Environment tests

### Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Ethernet network infrastructure

#### Presentation

The ConneXium<sup>™</sup> Industrial Ethernet Offer is comprised of a complete family of products and tools required to build the infrastructure of an Industrial Ethernet network. The following pages provide valuable information on the proper design of a network, and identifies the components necessary to build this infrastructure.

#### **Office Ethernet versus Industrial Ethernet**

There are three main areas of differentiation between Ethernet applications in an office environment and Ethernet applications in an Industrial environment, they are:

Environment

- Layout (not physical layer specification)
- Performance

Contrary to the office environment and even though ISO/IEC is working on it, there are not yet clearly defined specifications for Ethernet devices targeted to Industrial applications. The specifications of what it is called Industrial Ethernet are defined by different agencies or entities based upon its nature and based upon what the automation market has traditionally used.

The environmental specifications of Industrial Ethernet devices are today defined by the traditional agencies that define the environmental specifications for standard industrial devices (UL, CSA, CE, ...).

The IEEE 802.3 defines the physical layer specifications of the Ethernet network (types of connectors, distance between devices, number of devices, ...) while the 11801 (similarly to the TIAEIA 568B, and CENELEC EN 50173) provide installers the layout guidelines; therefore when designing and Industrial Ethernet network and selecting its infrastructure components the IEEE 802.3 rules for quantities of devices and lengths.

The performance specifications are actually being worked on by ISO/IEC.

#### Ethernet 802.3 principles

The Ethernet 802.3 Link Layer is based on a collision detection mechanism (CSMA CD): every node whose information has collided on the network realizes the collision and re-sends the information.

The process of re-sending information causes delays in its propagation and could affect the application.

A collision domain is a group of Ethernet end devices interconnected by hubs or repeaters (devices that receive information and send it out to their other ports, no matter where the destination device is connected): it means that devices will be affected by collisions.

With the availability of full duplex switches (devices that receive information and send it out just through the port to which the destination device is connected) the collision domains have disappeared.

Therefore, for industrial automation applications it is strongly recommended to use in every case full duplex switches to interconnect devices. In this way the collision domains will be eliminated completely.

### Topologies

### Modicon<sup>®</sup> Premium<sup>™</sup> automation platform

Ethernet network infrastructure

#### **Different network topologies**

Next there is a description of some of the available network topologies.

#### Star topology

In a star topology, devices are connected though an intermediate device.

#### Ethernet Star

In an Ethernet star the intermediate device may be a **hub** or a **switch**. Star is the commonly used topology in corporate networks and as of today is adopted in almost every automation application. As mentioned previously, for industrial Ethernet applications the use of full duplex switches as central device rather than hubs is strongly recommended.

#### Deploying Star topologies with ConneXium<sup>™</sup>

With any of the hubs and switches offered by the ConneXium offer, star topologies can be implemented.

#### Bus topology

The bus is one of the most adopted topologies in traditional industrial automation networks. A single trunk cable connects the devices on the network usually via passive or active T-connectors, or directly chained (daisy chain). Devices usually can be installed anywhere along the bus.

#### Ethernet Bus

An Ethernet bus can be deployed by interconnecting **hubs** and/or **switches** in line and considering every one of them as the connection for a drop device. A limited number of hubs and an unlimited number of switches can be interconnected to achieve this purpose.

#### Deploying Bus topologies with ConneXium<sup>™</sup>

With any of the hubs and switches offered by the ConneXium offer bus topologies can be implemented. Specially suitable for this purpose are the switches with 1 or 2 fiber-optic ports. The 2 fiber-optic ports switches could be for connection of inline devices while the single fiber-optic port switches could be used for the connection of end line devices.

#### Daisy chain topology

Daisy chain -along bus- is the other most adopted topology in traditional industrial automation networks. Cable segments interconnect multiple devices, being the devices "part" of the network cable.

#### Ethernet daisy chain

Daisy chain is not today a very common Ethernet topology, but it will soon become one of the most popular ones when enough quantity of devices is made available. In Ethernet daisy chain the devices have **2 Ethernet ports** and an **embedded switch**. Schneider Electric continues to release innovative Ethernet products to the Industrial market, especially designed to connect to daisy chain architectures.

#### Deploying daisy chain topologies

To deploy daisy chain topologies, no hubs or switches are required. Devices have an embedded switch.

Dual port Ethernet at the device level is an absolute integral component for daisy chain topologies. Each device in the network has at least two Ethernet ports. One port of the device connects to one port of the neighboring device on either side of the device. These neighboring connections make up the daisy chain. Ethernet switches can be employed in a daisy chain topology when multiple scan chains are in use by the controlling device. It is expected that the Ethernet switch will be located near the controlling device with the different scan chains emanating from the switch.

### Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Ethernet network infrastructure

#### Different network topologies (continued)

Daisy chain topology (continued)

#### Limitations of daisy chain:

The limitations of daisy chain technology in maintaining the operational integrity of the network and meeting performance metrics, are:

- Dual port Ethernet devices only support 10 Mbit/s and/or 100 Mbit/s operational speeds and must use one or the other.
- The network will operate only as fast as the slowest device that is connected to the network
- In order to improve network traffic latency the numbers of devices in a single scan chain, has been limited to 32 devices.

■ Limiting a single scan chain to 32 devices the time for a round trip of a packet through the daisy chain is expected less than 5 milliseconds (with 32 devices plugged on a scan daisy chain.

The maximum packet latency of a packet passing through any device in a scan chain is no more than 10  $\mu s.$ 

The first Schneider Electric device to be designed with Ethernet daisy chain capabilities is the Lexium  $^{\odot}$  15/17D servodrive.

#### **Ring topology**

In a ring topology, devices or network infrastructure components are connected in a loop with no beginning or end. Through these types of topologies a type of network redundancy is achieved.

#### Ethernet Ring

Ethernet rings are usually the backbones of applications in which high availability is required. If ring topology is required then switches that support this feature should be ordered.

#### Deploying Ring topologies using ConneXium™

The ConneXium line offers hubs and switches that allow the deployment of single and coupled self-healing rings. There is additional information about this topic in the redundancy segment.

### Modicon<sup>®</sup> Premium<sup>™</sup> automation platform

Ethernet network infrastructure

#### Distance limitations and number of devices per segment

Based upon the 802.3, the distance limits and the numbers of devices in cascade are the following:

			J					
Туре	Maximum segment length (1)	Maximum segment length (offered by ConneXium <sup>™</sup> devices)	hubs in cascade	Maximum number of switches in cascade				
10BASE-T	100 m	100 m	4	Unlimited				
100BASE-TX	100 m	100 m	2	Unlimited				
1000BASE-T	100 m	100 m	-	Unlimited				
10BASE-FL	2000 m	3100 m <i>(2)</i>	11 (fiber ring)	-				
100BASE-FX	412 m/2000 m	4000 m with multimode, 32.500 m with monomode <i>(3)</i>	-	Unlimited				
1000BASE-SX	275 m	-	-	Unlimited				
-	(1) Based on 802.3, full duplex/half duplex.							

(2) Depends on the optical budget and fiber attenuation.
 (3) Depends on the optical fiber budget and fiber attenuation, typical specification is 2 km for multimode and 15 km from monomode.

#### **Physical Media**

The Ethernet 802.3 defines the Physical Layer. A summary of the most common media is shown below

Туре	Data rate	Cable type		Connector type		
		Defined by 802.3	Recommended by Schneider Electric	Defined by 802.3	Recommended by Schneider Electric	
10BASE-T	10 Mbit/s	CAT 3 - UTP	CAT 5E - STP	RJ45	RJ45	
100BASE-TX	100 Mbit/s	CAT 5 - UTP	CAT 5E - STP	RJ45	RJ45	
1000BASE-T	1 Gbit/s	CAT 5 - UTP	CAT 5E - STP	RJ45	RJ45	
10BASE-FL	10 Mbit/s	Two multimode fiber-optic cables typically 62.5/125 µm fiber, 850 nm light wavelength	Two multimode fiber-optic cables typically 62.5/125 µm fiber, 850 nm light wavelength	ST	ST	
100BASE-FX	100 Mbit/s	Two multimode optical fibers typically 62.5/125 µm multimode fiber, 1300 nm light wavelength	Two multimode optical fibers typically 62.5/125 µm multimode fiber, 1300 nm light wavelength	ST	SC	
		-	Two monomode optical fibers typically 9/125 µm multimode fiber, 1300 nm light wavelength	-	SC	
1000BASE-SX	1 Gbit/s	Two 62.5/125 or 50/125 multimode optical fibers, 770 to 860 nm light wavelength	Two 62.5/125 µm or 50/125 m multimode optical fibers , 1300 nm light wavelength	SC	LC	
1000BASE-LX	1 Gbit/s	-	Two 9/125 µm monomode optical fibers, 1300 nm light wavelength	-	LC	

Note : The above are the specifications defined by IEEE 802.3. However some of the cables are no longer being developed. For instance, for 10BASE-T and 100BASE-TX, a CAT-5e cable is used.

### Modicon<sup>®</sup> Premium<sup>™</sup> automation platform Ethernet network infrastructure

#### Management

The Ethernet devices in general (end devices and the cabling devices) devices may be divided in two categories: unmanaged and managed devices:

■ The unmanaged devices are those with no possibility to configure or control any of the parameters of the device.

■ The managed devices are those with possibility to configure or control the parameters of the device (manage them) and to access its internal information.

The ConneXium<sup>™</sup> product line offers both types of devices.

There is also a third category of devices not specifically defined but is important to understand the difference. These devices only allow access to its information but can not be controlled and/or configured. Usually these devices are considered in the category of managed devices.

#### Managed devices

#### The managed devices offer the following features:

■ Traffic optimization and filtering, goal is to increase the bandwidth, or the traffic capacity in a network (some of the features in this area are message and port priority, flow control, multicast filtering, broadcast limiting, IGMP snooping, Vlan, etc.).

■ VLAN, a virtual LAN (VLAN) consists of a group of network participants in one or more network segments who can communicate with each other as if they belonged to the same LAN.

VLANs are based on logical (instead of physical) links. The biggest advantage of VLANs is their possibility of forming user groups based on the participant function and not on their physical location or medium.

Since broad/multicast data packets are transmitted exclusively within a virtual LAN, the remaining data network is unaffected. VLAN can also serve as a security mechanism to block unwanted Unicast messages.

■ Security, feature that helps the user protect the switch from unauthorized access that could result in changes in its configuration and impact the traffic going through the switch (some of the features in this area are port security, read/write community name, etc.).

User can also set up the switch so that it blocks messages coming from unauthorized "devices" source addresses connected to the switch.

**Time Synchronization,** feature that allows all the devices in the network to be synchronized on time.

Network Redundancy, to develop high availability applications.

### Redundancy

### Modicon<sup>®</sup> Premium<sup>™</sup> automation platform

Ethernet network infrastructure

# DITE D TE DTE 015 015 015

#### Redundancy

To develop high availability applications, "redundancy" in the networking infrastructure is the answer. By implementing a single ring architecture, or a coupled ring one, can protect themselves against losses of network segments.

#### Single Ring

The first level of redundancy is achieved by implementing a single ring. The ConneXium<sup>™</sup> switches allow the set up of backbone ring configurations.

The ring is constructed using the HIPER-Ring ports. If a section of the ring network becomes inoperative, a ring structure of up to 50 Switches transforms back to a line-type configuration within 0.5 seconds.

#### **Dual Ring**

The second level of redundancy is achieved by implementing a dual ring. The control intelligence built into the ConneXium switches allows the redundant coupling of HIPER-Rings and network segments.

These configurations would double the redundancy obtained by using a single ring.

#### Mesh topology using the Rapid Spanning Tree protocol

A third level of redundancy can be achieved by implementing a mesh topology. In simple terms spaning tree is a protocol that helps to ensure a single path for the signal, when multiple paths exist, and if the active path is broken, the spanning tree protocol enables one of the alternatives paths. ConneXium™ switches provide this needed flexibility.

#### **Technical appendices** Certifications for automation products EC regulations

Some countries require certain electrical components to undergo certification by law. This certification takes the form of a certificate of conformity to the relevant standards and is issued by the official body in question. Where applicable, certified devices must be labelled accordingly. Use of electrical equipment on board merchant vessels generally implies that it has gained prior approval (i.e. certification) by certain shipping classification societies.

Abbreviated name	Certification body	Country
CSA	Canadian Standards Association	Canada
C-Tick	Australian Communication Authority	Australia, New Zealand
GOST	Scientific research institute for GOST standards	CIS, Russia
UL	Underwriters Laboratories	USA
Abbreviated name	Classification society	Country
IACS	International Association of Classification Societies	International

Certifications pending for I/O extension modules (discrete TM2 D and analog TM2 A).

**EC regulations** 

#### **European Directives**

The open nature of the European markets assumes harmonization between the regulations set by different European Union member states. European Directives are texts whose aim is to remove restrictions on free circulation of goods and which must be applied within all European Union states. Member states are obligated to incorporate each Directive into their national legislation, while at the same time withdrawing any regulation that contradicts it. Directives - and particularly those of a technical nature with which we are concerned - merely set out the objectives to be fulfilled (referred to as "essential requirements"). The manufacturer is obligated to implement any and all measures to help ensure that its products meet the requirements of each Directive that applies to its equipment. As a general rule, the manufacturer certifies compliance with essential requirements of the Directive(s) that apply to its product by applying a C€ mark. The C€ mark has been applied to our products where applicable.

#### Significance of the CE mark

■ The appearance of a C€ mark on a product indicates the manufacturer's certification that the product conforms to the relevant European Directives; this is a prerequisite for placing a product which is subject to the requirements of one or more Directives on the market and for allowing its free circulation within European Union states

■ The C€ mark is intended for use by those responsible for regulating national markets.

Where electrical equipment is concerned, conformity to standards indicates that the product is fit for use. Only a warranty by a well-known manufacturer can provide assurance of a high level of quality.

As far as our products are concerned, one or more Directives are likely to apply in each case; in particular:

- The Low Voltage Directive (2006/95/EC)
- The Electromagnetic Compatibility Directive (2004/108/EC)
- The ATEX C€ Directive (94/9/EC)

MFB (Motion Function Blocks) Library Motion control

MFB: Motion control distributed over CANopen

#### **Presentation**

MFB (Motion Function Blocks) is a library of function blocks integrated in Unity<sup>™</sup> Pro software used to set up motion control in the architectures of drives and servo drives on machine buses and CANopen installations:

- □ Altivar® 31: For asynchronous motors from 0.18 to 15 kW
- □ Altivar<sup>®</sup> 71: For asynchronous motors from 0.37 to 500 kW
- □ Lexium<sup>®</sup> 05: For servo motors from 0.4 to 6 kW
- □ Lexium® 15LP/MP/HP: For BSH and BDH servo motors from 0.9 to 42.5 kW
- Lexium<sup>®</sup> 17D: For BPH, BPL and SER servo motors from 1.5 to 70 A rms (1)
- □ IcIA IFA/IFE/IFS: For integrated motor drives from 0.05 to 0.25 kW

In compliance with PLCopen specifications, the MFB library allows both easy and flexible motion programming with Unity Pro<sup>™</sup>, as well as axis diagnosis. In maintenance operations, drives can be replaced quickly, thanks to drive parameter download blocks.

Setting up drives on the CANopen network is facilitated through Motion Tree Manager organization in the Unity<sup>™</sup> Pro browser, making it easy for users to access the application drives.

#### Applications

The features of the Motion Function Blocks library are particularly suitable for machines with independent axes. In the case of these modular/special machines, MFB function blocks are the perfect solution for controlling single axes. The following are typical applications for this type of architecture:

- □ Automatic storage/removal
- □ Handling
- □ Palletizers/depalletizers
- □ Conveyors
- D Packaging, simple label application
- □ Grouping/ungrouping
- □ Adjustment axes in flexible machines, etc.

#### **Functions**

The table below lists the function blocks of the MFB library and the drives compatible with them. The prefix indicates the block family:

- □ MC: Function block defined by the Motion Function Blocks PLCopen standard
- □ TE: Function block specific to Telemecanique products
- Lxm: Function block specific to Lexium servo drives

Туре	Function	Function block	Altivar 31	Altivar 71	Lexium 05	Lexium 15 HP/MP/LP	Lexium 17D (1)	ICIA IFA/ IFE/IFS
Management	Read an internal parameter	MC_ReadParameter						
and motion	Write an internal parameter	MC_WriteParameter						
	Read the current position	MC_ReadActualPosition						
	Read the instantaneous speed	MC_ReadActualVelocity						
	Acknowledge error messages	MC_Reset						
	Stop active movement	MC_Stop						
	Axis coming to standstill	MC_Power						
	Movement to absolute position	MC_MoveAbsolute						
	Relative movement	MC_MoveRelative						
	Additional movement	MC_MoveAdditive						
	Homing	MC_Home						
	Movement at given speed	MC_MoveVelocity						
	Read diagnostic data	MC_ReadAxisError						
	Read servo drive status	MC_ReadStatus						
	Torque Control command	MC_TorqueControl						
Save and	Reading of actual torque value command	MC_ReadActualTorque						
	Manual move command	MC_Jog				Except LP		
Save and	Read parameters and store in PLC memory	TE_UploadDriveParam						
restore parameters (FDR)	Write parameters from the PLC memory	TE_DownloadDriveParam						
Advanced	Set the reduction ratio	Lxm_GearPos						
Lexium®	Read a motion task	Lxm_UploadMTask						
functions	Write a motion task	Lxm_DownloadMTask						
	Start a motion task	Lxm_StartMTask						
System	Communication with the servo drive	TE_CAN_Handler

#### 

General parameters: Axis name and address

MFB: Programming a movement in absolute mode

#### Motion Tree Manager

×

Motion Tree Manager is associated with the Unity<sup>™</sup> Pro MFB library, and integrated in its browser. It provides specific assistance for:

- Axis object management
- Axis variable definition
- Drive parameter management

Motion Tree Manager automatically creates links between the CANopen bus configuration and the MFB function block data using a limited amount of configuration data.

#### **General axis parameters**

In this tab, the designer is prompted to define:

- The name of the axis that will identify it in the browser for the entire application
- The address of the drive on the CANopen bus

#### Axis parameters

The dropdown lists in this tab are used to determine the exact type of drive: including both family and version.

#### Variable names

This last tab is used to identify data structures:

Axis\_Reference, used by the instances of function blocks for the axis in question
 CAN\_Handler, used to manage communication with the drive via the CANopen network

#### **Recipe definition**

The "recipes" attached to the axis are the data structures containing the adjustment parameters of a given drive. This data is used when:

■ Changing the drive with restoration of the context during "Faulty Device Replacement" maintenance

■ Changing the manufacturing program of the machine, and calling up an appropriate set of parameters, such as servo control gains, limitations etc. adapted to the weight and size of the moving parts.

Save of recipe parameters initial values in the PLC application.

#### Programming, diagnostics and maintenance

Communication between the PLC and drive is automatically set up by the system as soon as a TE\_CAN\_Handler instance is declared in the Unity Pro task with which the axis is associated.

Movements are then programmed by sequencing function blocks from the library in the Unity<sup>™</sup> Pro editor as selected by the user (LD, ST, FBD).

The two function blocks, MC\_ReadStatus, and in some cases MC\_ReadAxisError, are useful for determining the overall status of the axis, and the code of active warnings or detected errors.

The function blocks TE\_UploadDriveParam and TE\_DownloadDriveParam allow the application to save the parameters of a drive (recipe) and to then quickly reload them into another drive if the first one becomes inoperative.
